< -1.455	2571 (58.6)	2305 (70.9)	266 (23.4)	
$-1.455 \leq NFS < 0.676$	1461 (33.3)	818 (25.2)	643 (56.5)	
≥ 0.676	357 (8.1)	127 (3.9)	230 (20.2)	
Severity of hepatic steatosis (%)				< 0.001
Mild	1586 (34.8)	1295 (38.2)	291 (24.8)	
Moderate	1987 (43.6)	1432 (42.3)	555 (47.4)	
Severe	986 (21.6)	660 (19.5)	326 (27.8)	

Continuous values are presented as medians (interquartile range) and categorical variables are presented as counts (percentages). DM, diabetes mellitus; Non-DM, patients without diabetes mellitus; BMI, body mass index; ALT, alanine transaminase; AST, aspartate transaminase; ALP, alkaline phosphatase; PLT, Serum selenium, platelet; TC, total cholesterol; TG, total triglyceride; HDL-C, high-density lipoprotein cholesterol; ALB, total protein, albumin; UA, uric acid; Scr, serum creatinine; eGFR, estimated glomerular filtration rate; NFS, NAFLD fibrosis score; FIB-4, Fibrosis-4 index.

Supplementary Figure S1. Association of DM with all-cause mortality in MAFLD of different (A) ages and (B) BMI.

Supplementary Figure S2. Subgroup analysis of the association of DM with cancer related mortality in MAFLD patients.

Supplementary Figure S3. Subgroup analysis of the association of DM with non-cardiovascular related mortality in MAFLD patients.

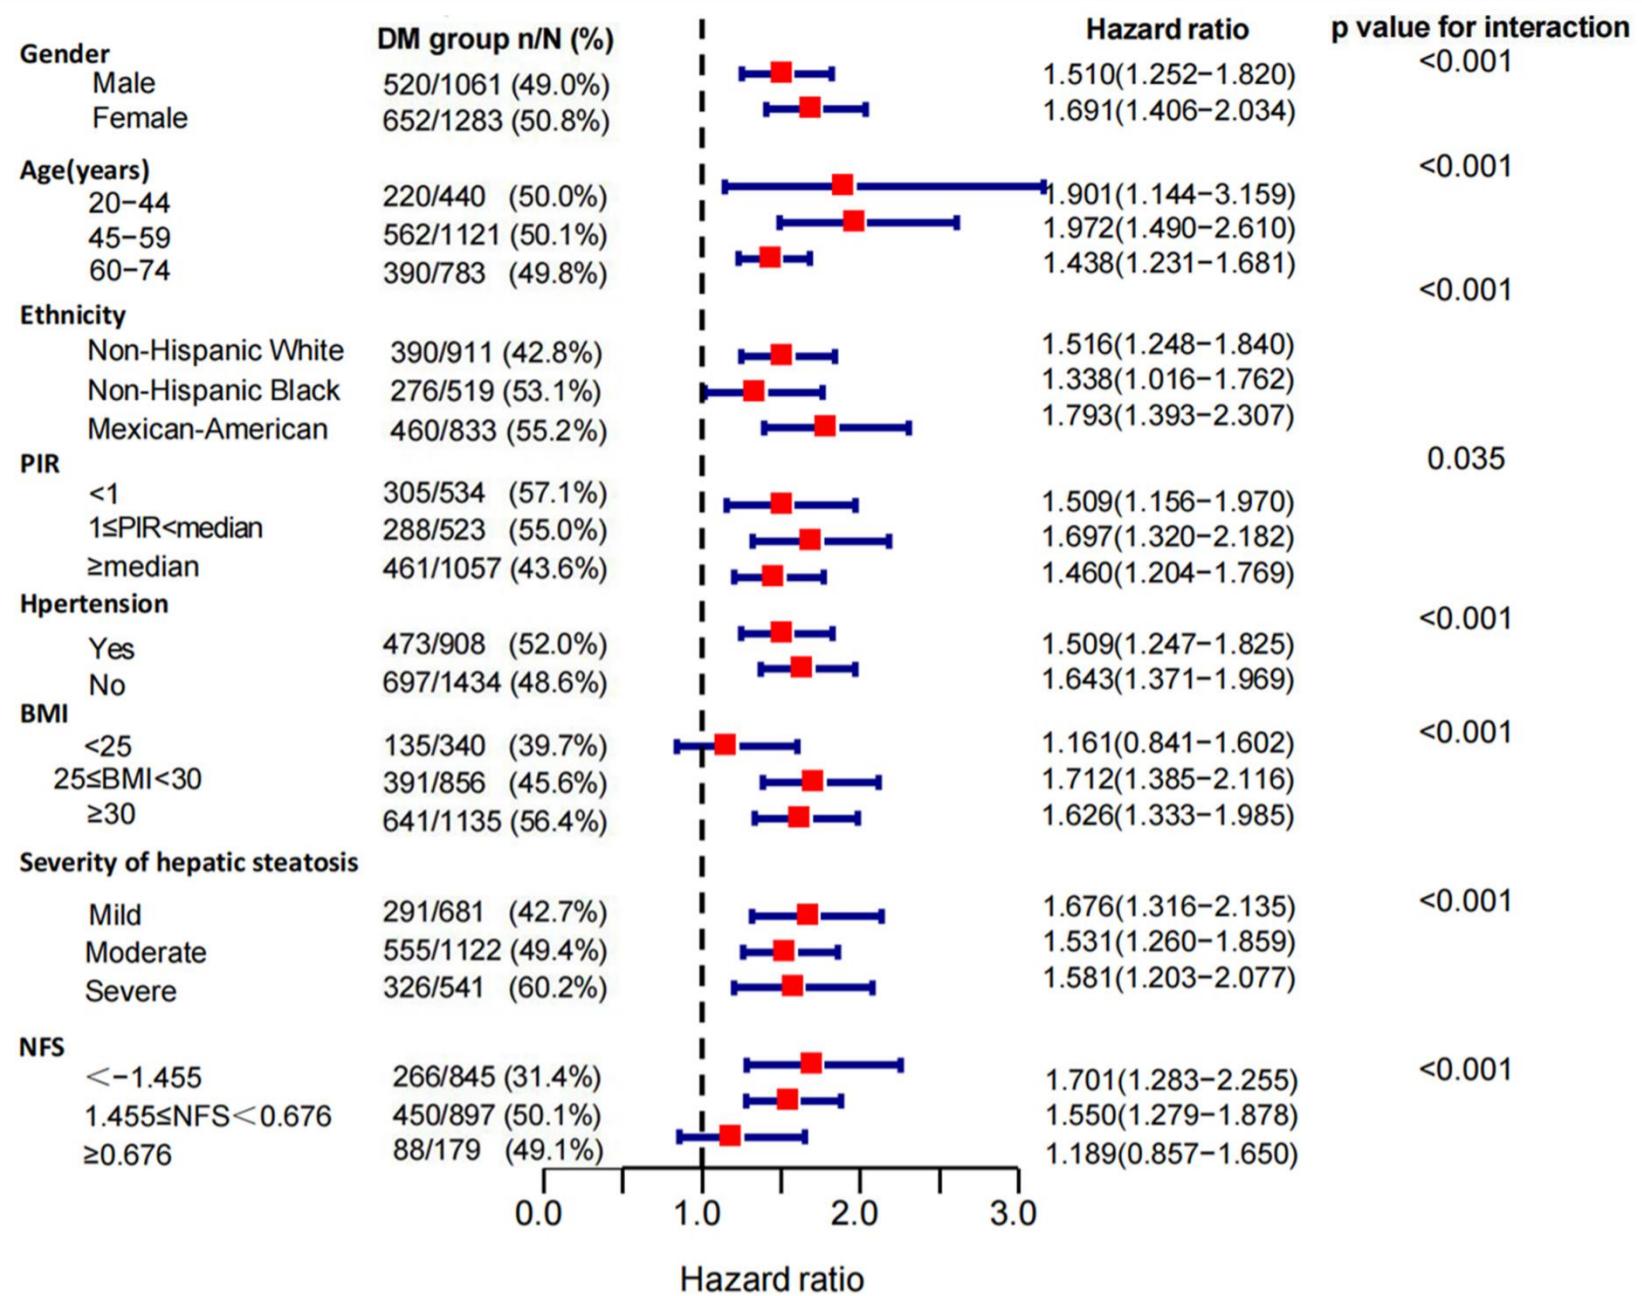

FIGURE LEGENDS

Supplementary Figure S1. Association of DM with all-cause mortality in MAFLD of different (A) ages and (B) BMI.

Supplementary Figure S2. Subgroup analysis of the association of DM with cancer related mortality in MAFLD patients.

Associations between DM and risk of cancer related mortality stratified by baseline age, gender, ethnicity, PIR (poverty income ratio), hypertension, BMI, severity of hepatic steatosis, and NFS scores in patients with MAFLD. The model was adjusted by age (not adjusted in subgroup analysis by age), gender (not adjusted in subgroup analysis by gender), ethnicity (not adjusted in subgroup analysis by ethnicity), PIR (not adjusted in subgroup analysis by PIR), hypertension (not adjusted in subgroup analysis by hypertension) and BMI (not adjusted in subgroup analysis by BMI). Diabetes, compared with non-diabetes patients.

Supplementary Figure S3. Subgroup analysis of the association of DM with non-cardiovascular related mortality in MAFLD patients.

Associations between DM and risk of non-cardiovascular related mortality stratified by baseline age, gender, ethnicity, PIR (poverty income ratio), hypertension, BMI, severity of hepatic steatosis, and NFS scores in patients with MAFLD. The model was adjusted by age (not adjusted in subgroup analysis by age), gender (not adjusted in subgroup analysis by gender), ethnicity (not adjusted in subgroup analysis by ethnicity), PIR (not adjusted in subgroup analysis by PIR), hypertension (not adjusted in subgroup analysis by hypertension) and BMI (not adjusted in subgroup analysis by BMI). Diabetes, compared with non-diabetes patients.
