

Co-occurrence of Wing Deformity and Impaired Mobility of Alates with Deformed Wing Virus (DWV) in *Solenopsis invicta* Buren (Hymenoptera: Formicidae)

Godfrey P. Miles^a, Xiaofen F. Liu^a, Esmaeil Amiri^b, Michael J. Grodowitz^a, Margaret L. Allen^a, and Jian Chen^{a,1}

Author affiliations: ^aBiological Control of Pests Research Unit, USDA-ARS, Stoneville, MS 38776, USA; ^bMississippi State University, Delta Research and Extension Center, 82 Stoneville Road, Stoneville, MS 38776.

Supplementary Materials

Table S1. Information of *S. invicta* colonies used in this study.

Data Set S1A-H. Results of Sanger sequencing of *S. invicta* samples.

Videos. Description of eight videos depicting both DW and NW male and female alates from *S. invicta* lab and field colonies (<https://doi.org/10.5281/zenodo.8357376>).

Figure S1. Phylogenetic tree based on sequences from samples of *S. invicta* and positive control of *A. mellifera* with DWV against deformed wing virus sequence fragments on which the sequencing primer sets were located.

Colonies G-1 and G-2 were initiated using new queens collected on July 21, 2021, in a parking lot of Nelco Cineplex, Greenville, Mississippi. The apparatus method used to set up the new colonies was described by [34].

Supplementary Materials: Data Set S1A. Results of Sanger sequencing of samples of *S. invicta* ants from Figure 3., showing positive results for replicative form of DWV: adult workers from colony 8, (pooled, $n=10$), worker pupae, colony 10, (pooled, $n=5$), and deformed wing (DW) male alates, colony 8, (pooled, $n=5$), showing positive detection for the replicative form of DWV using a tag-primer that was incorporated into a fragment of the RNA-dependent RNA polymerase (RD-RP) gene during the reverse transcriptase step. Samples were ten-times diluted. Additional sequence is from a NW male alates showing the replicative form of the DWV, which is at two-times dilution.

Supplementary Materials: Data Set S1.

In the above sequencing results, **(A)** Results of Sanger sequencing of samples of *S. invicta* ants from Figure 3., showing positive results for replicative form of DWV: adult workers from colony 8, (pooled, $n=10$), worker pupae, colony 10, (pooled, $n=5$), and deformed wing (DW) male alates, colony 8, (pooled, $n = 5$), showing positive detection for the replicative form of DWV using a tag-primer that was incorporated into a fragment of the RNA-dependent RNA polymerase (RD-RP) gene during the reverse transcriptase step. Samples were ten-times diluted. Additional sequence is from a NW male alates showing the replicative form of the DWV, which is at two-times dilution. **(B)** are results for Sanger sequencing showing the identification of DWV-A to be present in *S. invicta* workers from the following colonies read assignments are as follows: 1.) Col. 2021-worker ants-DWV-A, 2.) Col. B1-worker ants-DWV-A, 3.) Col. 14-worker ants-DWV-A, 4.) Col. 8-pupae-DWV-A, 6.) Col. Greenville-1-worker ants-DWV-A, 7.) Honeybee DWV (+) control. Also have a queen from Greenville-1 positive for DWV, and a NW female re-run positive for DWV. **(C)**, are results for Sanger sequencing showing the identification of DWV-A to be present in *S. invicta* workers and male and female alates with and without wing deformity. Read assignments are as follows: 1.) Col. 2021-worker ants-DWV-A, 2.) Col. B1-worker ants-DWV-A, 3.) Col. 14-worker ants-DWV-A, 4.) Col. 8-worker ants-DWV-A, 5.) Col. 8-pupae-DWV-A, 6.) Col. Greenville-1-worker ants-DWV-A, 7.) Col. Greenville-2 worker ants-DWV-A, 8.) DW-male alates ($n=5$)-DWV-A, 9.) NW male alates ($n=5$)-DWV-A, 10.) Col. 11-DW-male alate-DWV-A, 11.) Col. NCBL-DW-male alate-DWV-A, 12.) Col. 9-DW-male alate-DWV-A, 14.) DW-male-pooled-DWV-A. **(D)**, are Sanger sequencing detecting DWV-A in additional *S. invicta* male and female alates. Read assignments are as follows: 1-2.) Col. 4-DW male alates-DWV-A ($n=4$), 3-4.) Col. 4-NW male alates-DWV-A ($n=4$), 7-8.) Col. NBCL-7-NW female alates ($n=4$). All samples were pooled. Contig_1. **(E)**, are results for Sanger sequencing showing the identification of DWV-A to be present in a non-melanized pupa of *S. invicta*. **(F)**, are results for a re-run of a female DW alate due to original sequencing issues experienced on 20-Oct-2022. **(G)**, are results for Sanger sequencing showing the detection of replicative form of DWV in

various castes of *S. invicta*. Target gene is the RD-RP gene. Read assignments are as follows: 1-2.) Western honey bee (+ for DWV) *Apis mellifera*, 3) DW female, 4) DW female alate two-times dilution, 5) DW male alate, 6) Col. 14 DW male alate, 7) Col. 14 workers. (H) are results for tag-only primer used to sequence replicative form of DWV. Read assignments are as follows: 1-2) Western honey bee (+ for DWV) *Apis mellifera*, 3) NW male alate, 4) NW male alate two-times dilution, 5) DW female alate, 6) DW female alate two-times dilution, 7) Col. 8 DW male alate, 8) Col.14 workers.

Details for DNA gel electrophoresis results for *S. invicta*. All samples where there was an observed gel band corresponding to the positive control were sent off for Sanger sequencing. Not all sequencing worked; however, all samples that gave a readable sequence when blasted on NCBI, matched DWV. We used 5 µl of PCR product for DNA gel electrophoresis and, for DWV-A (PCR product size = 168 bp), 10 µl purified for Sanger sequencing. For worker ants (20 to 50 mg, fresh weight) and whole alates (single alate, 5 to 11 mg, fresh weight, or pooled, 30 to 50 mg), fresh weight. For the positive control, we used RNA from a Western honey bee with DW (+ for DWV) *Apis mellifera*. All no template controls (NTC) were negative for bands. For replicative form, all controls: NTC, no primers, and no transcriptase, were negative for bands.

Videos. Detailed description of eight videos depicting both deformed wing (DW) and normal wing (NW) male and female alates from numerous *S. invicta* lab and field colonies. The purposes for these videos are to let the reader observe the gross morphological and mobility differences between DW and NW alates. All videos were captured using a Keyence VHX 5000 (Itasca, IL), except for video 4, where a Samsung Galaxy J7 Star mobile phone, was used.

Video 1 Two deceased and one live DW male alate from *S. invicta* colony NBCL-2, which were collected directly from the *in situ* mound. Ants were collected the day before imaging. At the time of collecting and approximately 90 minutes before video capture, all three alates were alive and possessed some level of mobility but demonstrated an ataxic gait with difficulty righting themselves. All three alates have severe DW phenotype. The runtime for this video is 20 seconds.

Video 2 Two DW male alates and one NW male alate from Colony 8. The two DW alates are unable to right themselves. The alate, bottom left, died shortly after this video was taken. The alate on the right couldn't walk due to severely deformed legs. This is not a common deformity among the DW males thus far observed. The runtime for this video is 20 seconds.

Video 3 A DW male alate collected from colony 12 displaying severely deformed wings and an inability to walk. The alate's left back leg is partially paralyzed. Approximately three hours after video capture, the alate died. The runtime for this video is 25 seconds.

Video 4 Three DW male alates from colony 14. Two DW alates display severe leg deformity and are unable to stand or walk while the third, with slight wing deformity, displays mobility issues with its deformed left hind leg. The runtime for this video is 5 seconds.

Video 5 A cluster of DW male alates from colony 8 displaying various degrees of wing deformity. The runtime for this video is 20 seconds.

Video 6 A single DW male alate from colony 1. This alate has severely deformed wings and legs and is unable to right itself. The runtime for this video is 30 seconds.

Video 7 A single DW male alate from colony 3C. This alate has severely deformed wings and is unable to fully use its hind legs and, at a slower frame speed, one can see this alate is unable to fully extend its right front leg. The runtime for this video is 30 seconds.

Video 8 Two DW female alates – one with slight wing deformity and the other with severe wing deformity from Colony NBCL-12. Neither female alate shows any ataxia or paralysis. The runtime for this video is 30 seconds.
