## S1. METHODOLOGY

After selecting the final sample of papers, the project team developed a matrix (see separate Excel file dating from 31 July 2017) in which the main findings from the different literature studies could be summarised. It resembles a data extraction form, containing all information perceived relevant, in an attempt to provide a combined quantitative and qualitative analysis of the scientific state-of-the-art. The different literature studies are presented in a matrix table indicating:

- Which research questions are answered by the document;
- File name;
- Title of the document;
- The authors;
- Solution category for energy efficiency improvements:
  - o insulation and improvement of the envelope;
  - replacement of the equipment;
  - o on-site installations for renewable energy;
  - automation of the building;
  - o etc.
- Short description of the solution presented in the document;
- Source of or link to the document;
- Name of journal/paper;
- Country covered within the document;
- Publication year of the document;
- Building typology covered by the document;
- Whether it covers new build or refurbishment case(s);
- Typology of the energy performance;
- System boundaries of the LCA;
- Important assumptions in the study (e.g. allocation);
- · Additional comments related to the LCA modelling;
- Database used for the LCA modelling;
- Reference study period;

- Whether it is a qualitative or quantitative study;
- Additional comments on the document;
- Construction method of the covered case(s);
- Thermal insulation material used;
- Which parts of the building was included in the LCA;
- Applied assessment methodology;
- LCA software used;
- Indicators assessed;
- Gross floor area [m²];
- Net floor area [m²];
- Reference area for EE/EC [m²];
- Final operational energy demand [kWh/m²a];
- Final energy demand for electricity [kWh/m²a];
- Final energy demand for heating and hot water [kWh/m²a];
- Final energy demand for cooling [kWh/m²a];
- Climate change impacts for each stage of the building's life cycle, according to EN 15978 (from Modules A to D);
- Primary energy (non-renewable) consumption for each stage of the building's life cycle, according to EN 15978 (from Modules A to D);
- Abiotic Depletion Potential impacts for each stage of the building's life cycle, according to EN 15978 (from Modules A to D);
- Hazardous waste generation for each stage of the building's life cycle, according to EN 15978 (from Modules A to D);
- Single environmental score for each stage of the building's life cycle, according to EN 15978 (from Modules A to D);
- Fifteen columns show results calculated by the embedded formulae within the matrix, to portray each life cycle stage contribution to the assessed building's total load;
- Fifteen columns regarding the ratio of impacts caused by insulation and one column regarding
  the tipping point of insulation, followed the same number and type of columns but for
  renewable energy installations;
- And, finally, last ten columns include information regarding the financial cost.

## S2. RESULTS

#### S2.1 GENERAL OVERVIEW, META- ANALYSIS

### Number of papers reviewed

- 59 papers;
- 5 different scientific journals;
- 16 "others" = 1 EPD, 1 magazine article, 2 conference proceedings, 1 PhD thesis. 3 research reports, and 7 case studies.

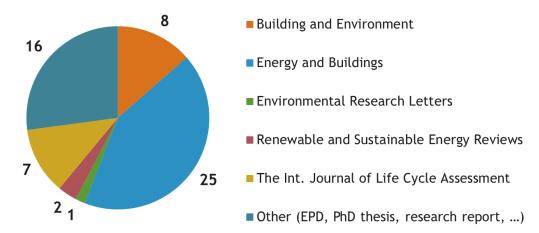

Figure S1: Number and types of papers reviewed

The 178 case studies covered 18 different countries: ■ Austria (16) ■ Belgium (12) ■ Czech Republic (1) ■ Denmark (1) Finland (15) ■ France (34) ■ Germany (5) Greece (1) ■ Ireland (6) ■ Italy (28) ■ Netherlands (5) Lithuania (1) ■ Norway (10) ■ Portugal (3) ■ Spain (3) ■ Sweden (18)

N/R (12)

Figure S2: Number of countries covered by the case studies.

(N/R = not relevant/review paper/ multiple countries)

• The energy performance level was given from 135 out of 178 case studies, and those 135 cases covered 7 types of energy performance level:

Switzerland (1)

■ United Kingdom (6)

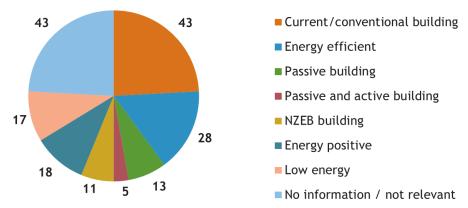

Figure S3: Types of energy performance levels covered by the case studies

• The 178 case studies covered 111 new built cases and 41 refurbishment cases:

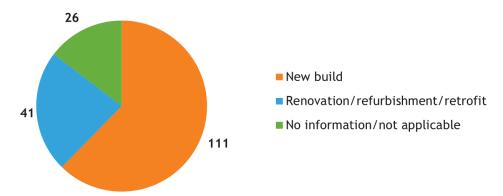

Figure S4: Division of new built – renovation case studies

172 out of 178 case studies covered 6 different system boundaries:

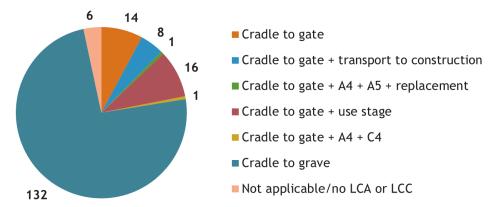

Figure S5: Types of system boundaries covered by the case studies

## S2.2 RESEARCH QUESTION 1 – RQ1

The presented ratios are results calculated with the matrix based on absolute figures taken from the papers or visually extrapolated from graphs within the papers. The project team divided the impact with a 95%-5% division for the cases where figures were given for the complete module A (i.e. production stage including construction stage, thus attributing 95% to the production stage and 5% to the construction stage). For a complete overview, e.g. for other impact categories or incomplete figures of other cases, please refer to the matrix.

Table S1: Life cycle impact assessment of three stone wool insulation thicknesses: 40, 80 and 120 mm (functional unit of 1  $m^2$  of living area over a period of 50 years) [22]

<sup>(\*)</sup> In the paper by Weilert al. (2017) one building was analysed on three levels of energy performance (i.e. conventional, passive, and low-energy). During the final meeting there were some questions regarding the comparison of the cases by Weiler; therefore Annex A presents some of the additional results by Weiler et al.

## S2.2.2 NEARLY ZERO-ENERGY BUILDINGS

	1	apartment	refurbishment		concrete					l					
		buildings	/ retrofit												

<sup>(\*)</sup> The negative values (i.e. benefits) in the use stage is explained by the presentence of a 6 kWp PV system, which produces more energy than the house consumes. The negative values in the end-of-life stage is explained by the assumed recycling/reusing processes. This paper does not apply the methodology of the EN 15804 and therefore includes the net benefits in the different stages instead of declaring them in a separate Module D.

<sup>(\*\*)</sup> In the paper by Weiler et al. (2017) one building was analysed on three levels of energy performance (i.e. conventional, passive, and low-energy). During the final meeting there were some questions regarding the comparison of the cases by Weiler; therefore Annex A presents some of the additional results by Weileret al. .

## S2.2.4ENERGY POSITIVE BUILDINGS

Table S5: Illustrative examples of the weight of each stage of energy positive cases.

						Relative contribution per life cycle stage to the total life cycle impact of the building [%]									
-							Climate	change			Primary	energy			
Paper	Country covered	Building typology	New build or refubishment?		Construction method	production stage	construction stage	use stage	end-of-life stage	production stage	construction stage	use stage	end-of-life stage		
Thiers and Peuportier, 2012	France	Residential - single-family or terrassed houses		N/A (built in 2007)	No information	42.6	2.1	34.0	21.3	89.0	4.5	4.3	2.2		
	France	Residential - single-family or terrassed houses		N/A (built in 2007)	No information	46.5	2.3	27.9	23.3	87.3	4.4	6.2	2.1		
	France	Residential - single-family or terrassed houses		N/A (built in 2007)	No information	46.5	2.3	27.9	23.3	79.0	4.0	15.5	1.5		
	France	Residential - multi- apartment buildings	refurbishment	,	No information	29.0	1.4	63.8	5.8	8.9	0.4	15.5 89.5 88.5	1.1		
	France	Residential - multi- apartment buildings	refurbishment	,	No information	32.8	1.6	59.0	6.6	9.8	0.5	88.5	1.2		
	France	Residential - multi- apartment buildings	refurbishment	,	No information	19.8	1.0	75.2	4.0	11.2	0.6	86.8	1.4		

## S2.2.5 LOW ENERGY BUILDINGS

Table S6: Illustrative examples of the weight of each stage of low energy cases.

						Relative contribution per life cycle stage to the total life cycle impact of the building [%]								
							Climate	change		Primary energy				
	Country		New build or	Reference		production	construction		end-of-life	production	construction		end-of-life	
Paper	covered	Building typology	refubishment?	study period	Construction method	stage	stage	use stage	stage	stage	stage	use stage	stage	
Blengini & Di Carlo,	Italy	Residential -	New build	N/A	Designed according to sustainable	56.5	3.0	45.9	-5.4	51.4	2.7	35.1	10.8	
2010		single-family or			and bioclimatic architecture									
		terrassed houses			principles									
Weiler et al., 2017 (*)	Germany	Residential - multi-	New build	50 years	Reinforced concrete frame	11.9	0.6	85.1	2.4	11.9	0.6	85.5	2.0	
		apartment												
		buildings												

<sup>(\*)</sup> In the paper by Weiler *et al.* (2017) one building was analysed on three levels of energy performance (i.e. conventional, passive, and low-energy). During the final meeting there were some questions regarding the comparison of the cases by Weiler; therefore Annex A presents some of the additional results by Weiler *et al.* .
