

**Supplementary figure 1.** Gating strategy for the identification of infected myeloid cells by flow cytometry. Single cells were identified by FSC-H vs. FSC-A gating. Subsequently, dead cells were excluded using Zombie Aqua. Single, live cells were further subdivided into FSChi/SSChi and FSCmed/SSClow cells. CD172a+/CD14+ cells among FSChi/SSChi in the blood were identified as granulocytes. In all tissues, monocytes and dendritic cells (DC) were identified as CD172a+/CD14+ and CD172a+/CD14-, respectively, among FSCmed/SSClow cells. p72 expression was analysed of each myeloid cell subset.

**Supplementary table 1.** Temperature profiles of control and infected domestic pigs from 0 to 10 days pi.
