

Supplementary Materials

Supplemental Figures

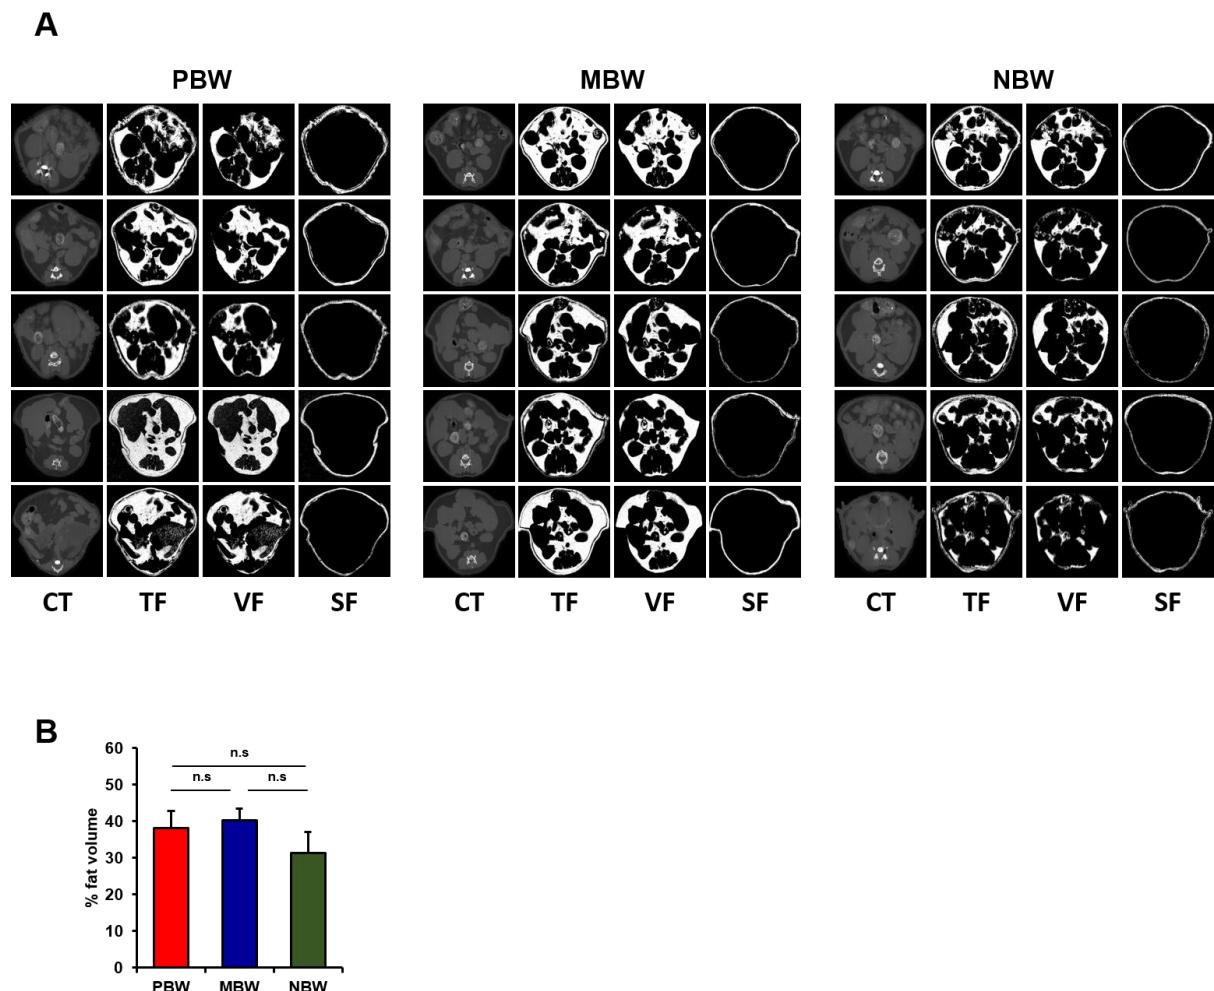

Figure S1. The representative micro-CT image of each experimental mouse of the PBW, MBW, and NBW groups three months after the gut microbiome replacement. (A) Micro-CT image, (B) The fat volume change of each group. TF, total fat; VF, visceral fat; SF, subcutaneous fat. The values are represented as mean \pm SEM. n.s.: not significant ($p > 0.05$).

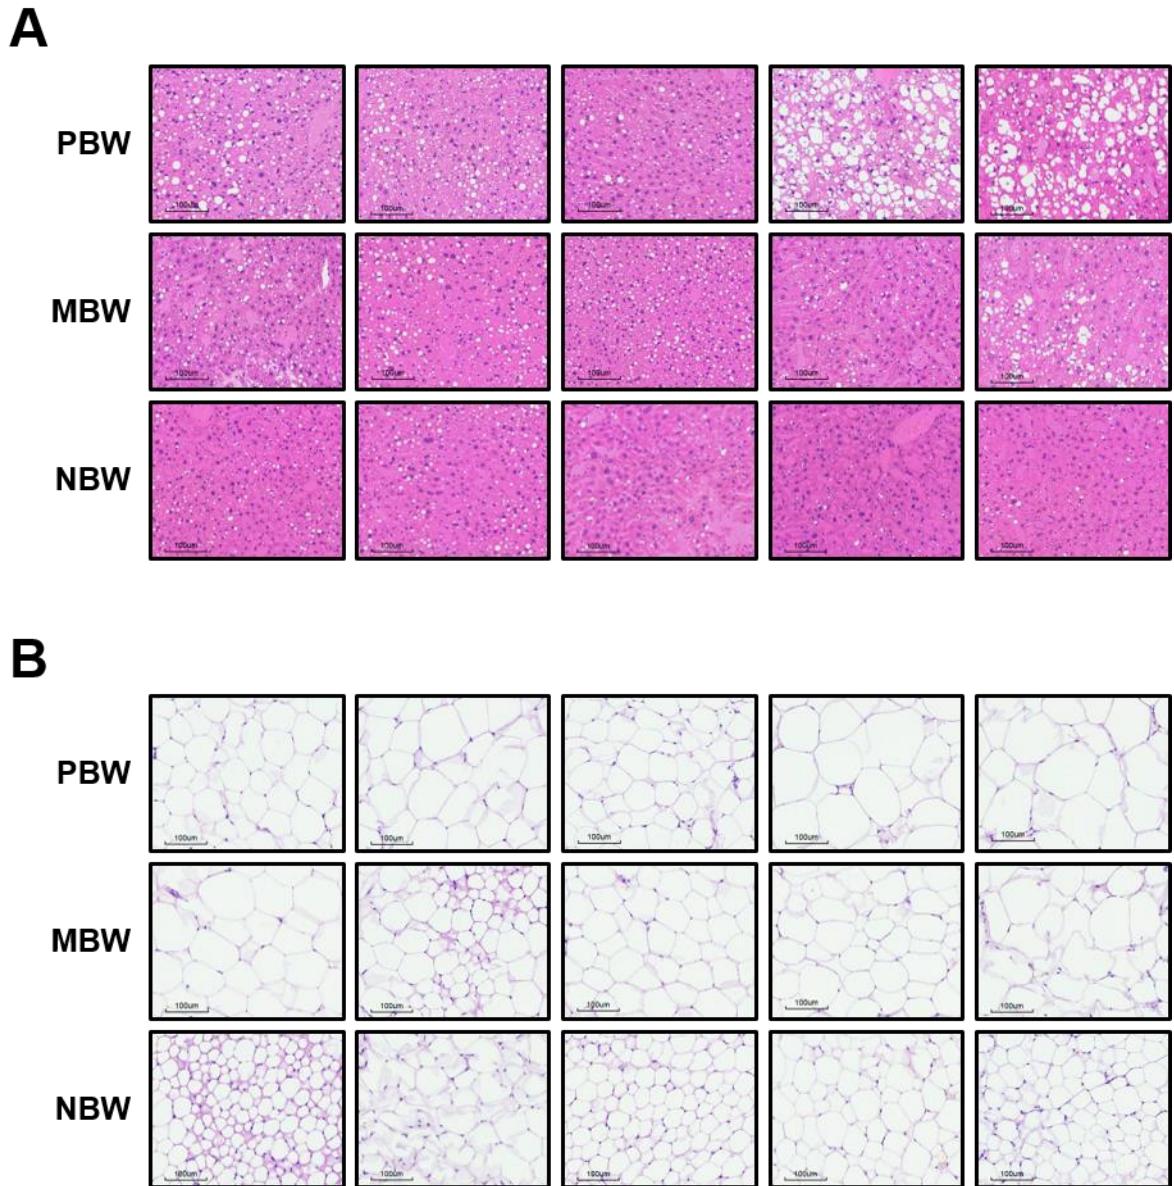

Figure S2. The representative histological images of each experimental mouse of the PBW, MBW, and NBW groups three months after gut microbiome replacement. (A) The H&E-stained liver images. **(B)** The H&E-stained adipose tissue images. Scale bars, 100 μm in all the images.

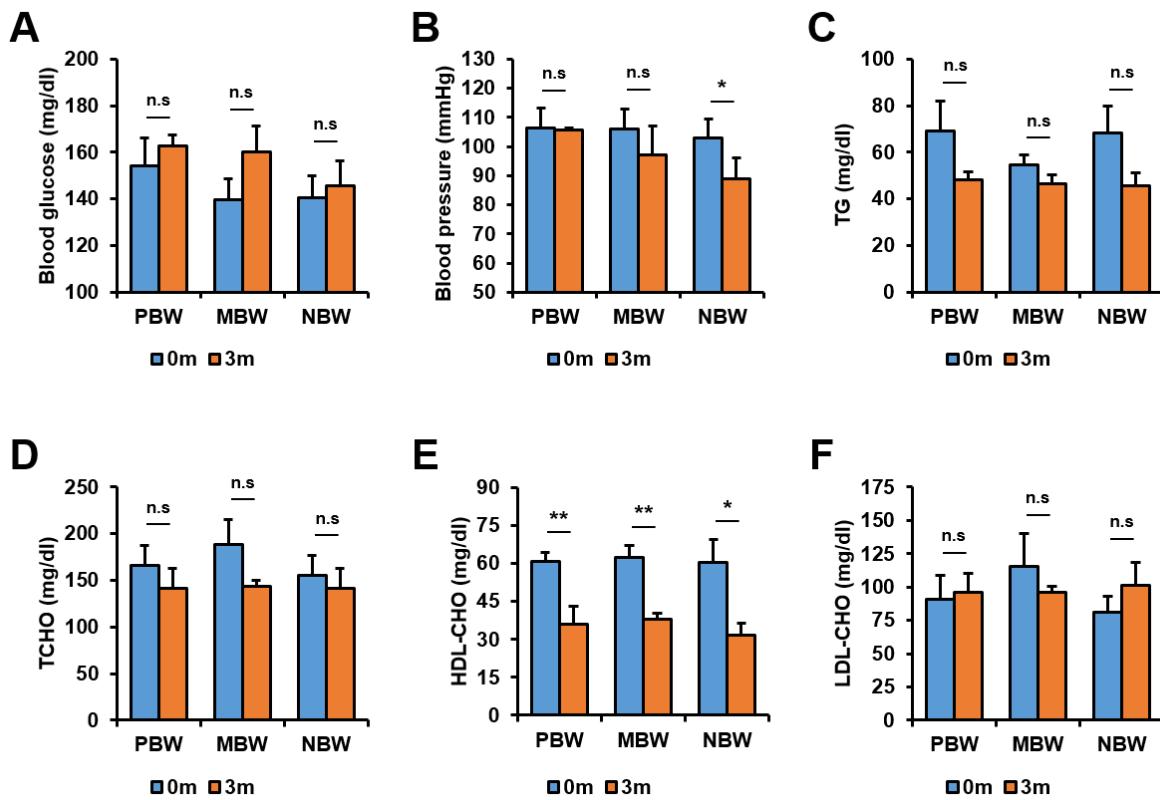

Figure S3. The effects of the gut microbiome replacement on the changes in the blood glucose, blood pressure, and lipid levels. The average values of (A) Blood glucose, (B) Blood pressure, (C) Total glycerol (TG), (D) Total cholesterol (TCHO), (E) HDL-cholesterol (HDL-CHO) (F) LDL-cholesterol (LDL-CHO) of each group are shown. The values are represented as mean \pm SEM. 0m represents before the gut microbiome replacement, and 3m represents 3 months after the gut microbiome replacement. * $p < 0.05$; ** $p < 0.01$; n.s.: not significant ($p > 0.05$).

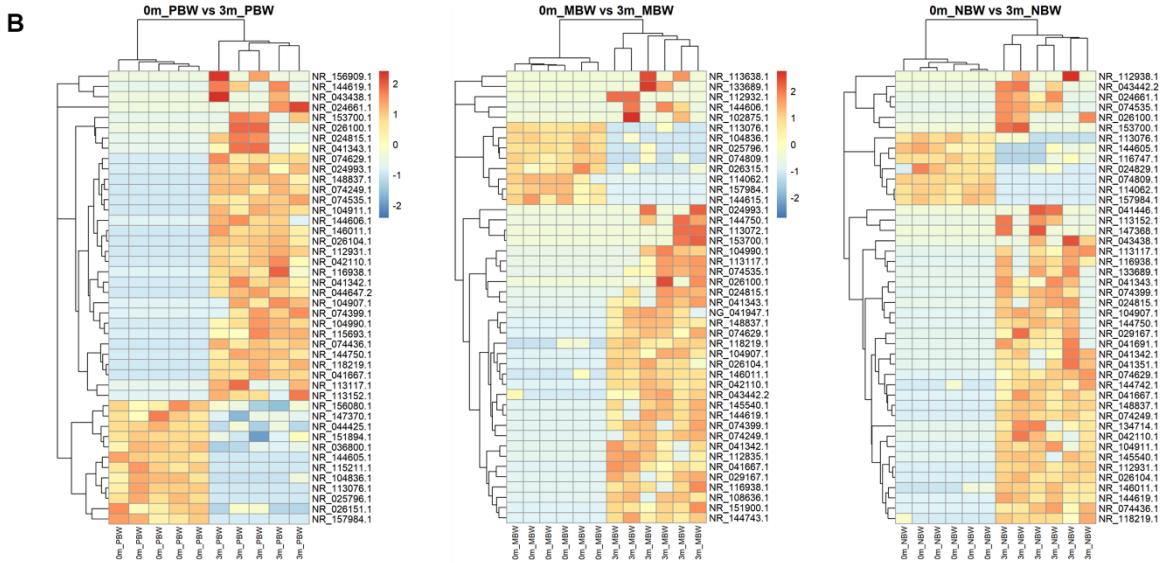

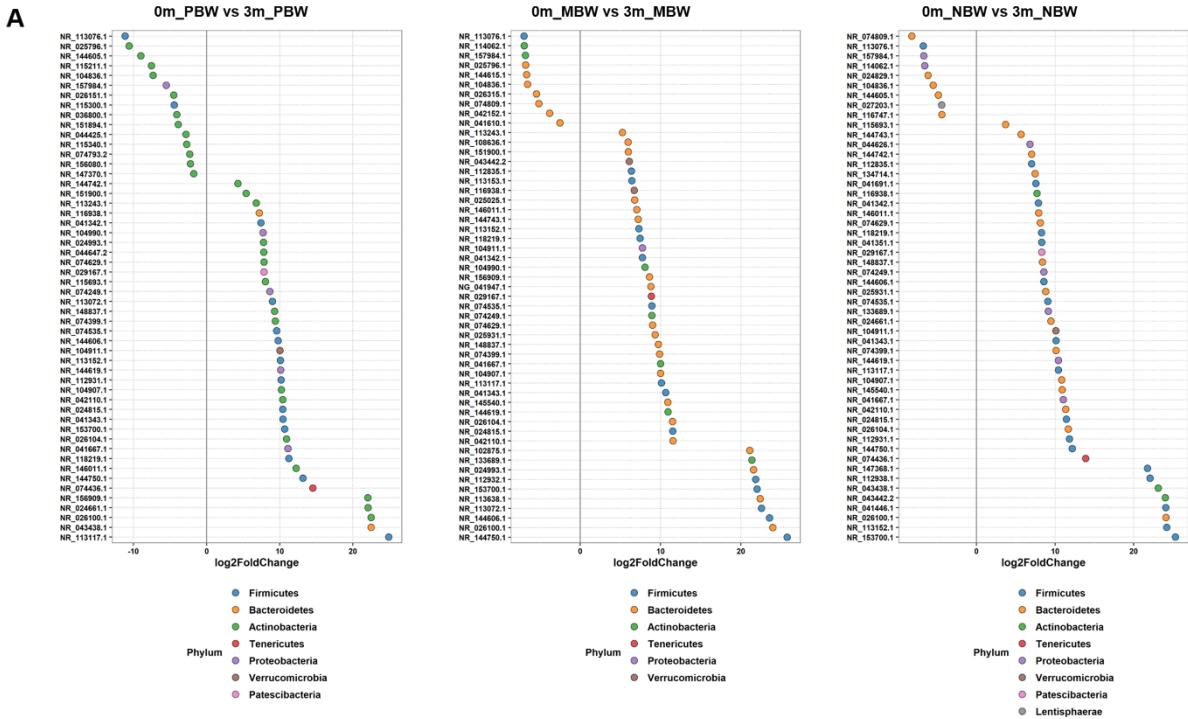

Figure S4. Differential abundance analysis of species changes of each group before and after the gut microbiome replacement. **(A)** Dotplots showing significantly differentially abundant OTUs, where OTUs are sorted by species along the y-axis and colored by phylum, analyzed by DESeq2 differential abundance analysis. The x-axis indicates the log2 fold-change in 3 month of each group compared to 0 month of each groups as baseline. **(B)** Heatmaps of significantly differentially abundant species in 0 month and 3 month of each group.

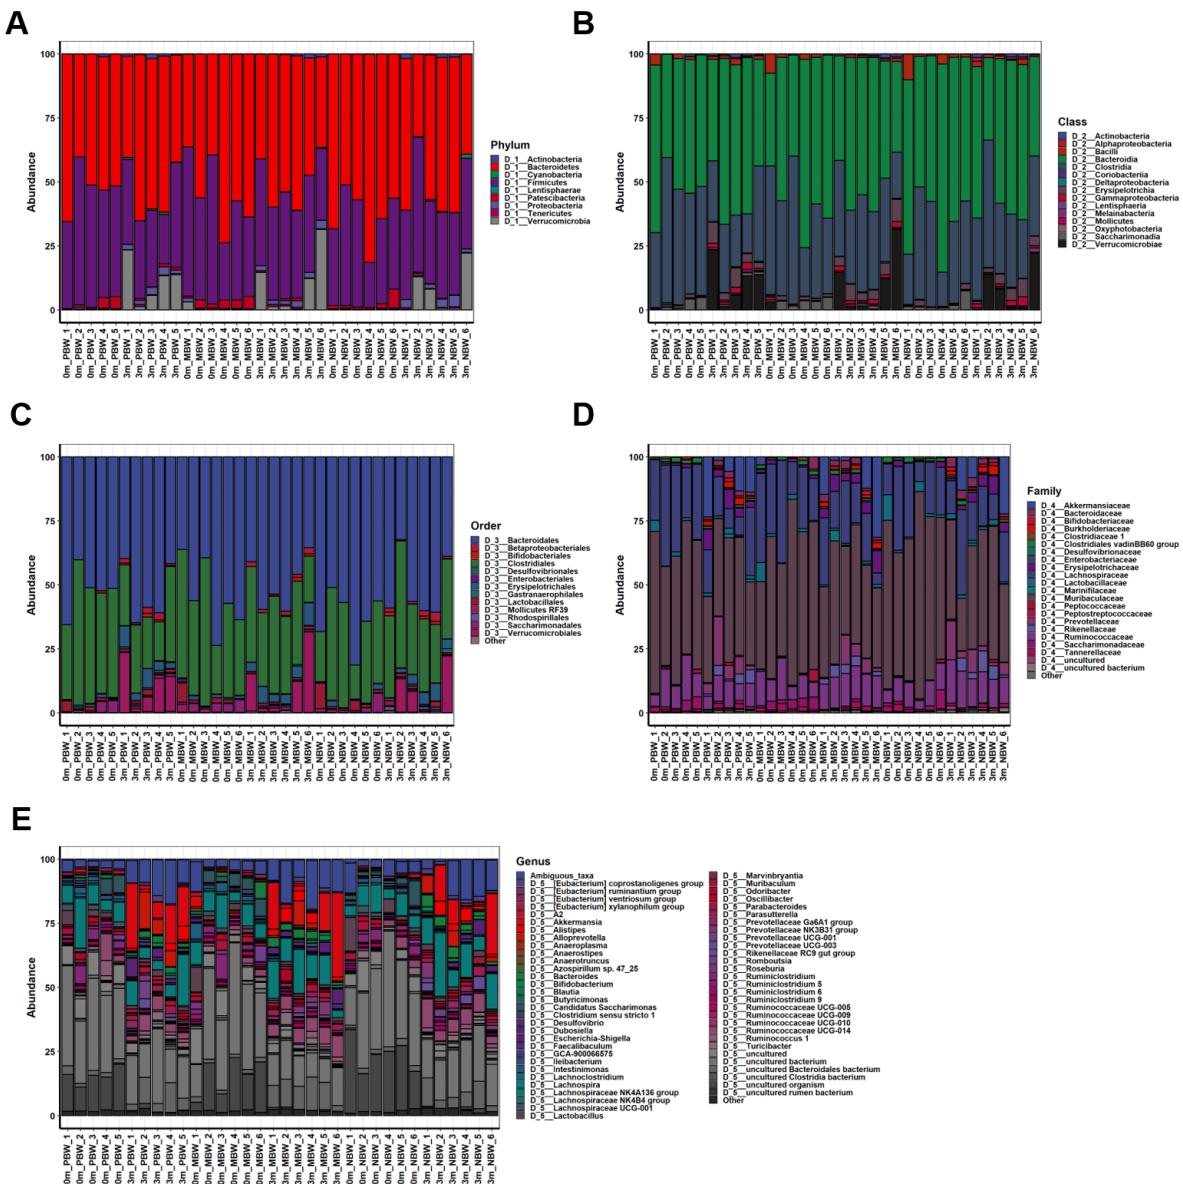

Figure S5. Changes in the composition of the gut microbiome of each mouse before and after the gut microbiome replacement. (A) Phylum level, (B) Class level, (C) Order level, (D) Family level, and (E) Genus level are shown.

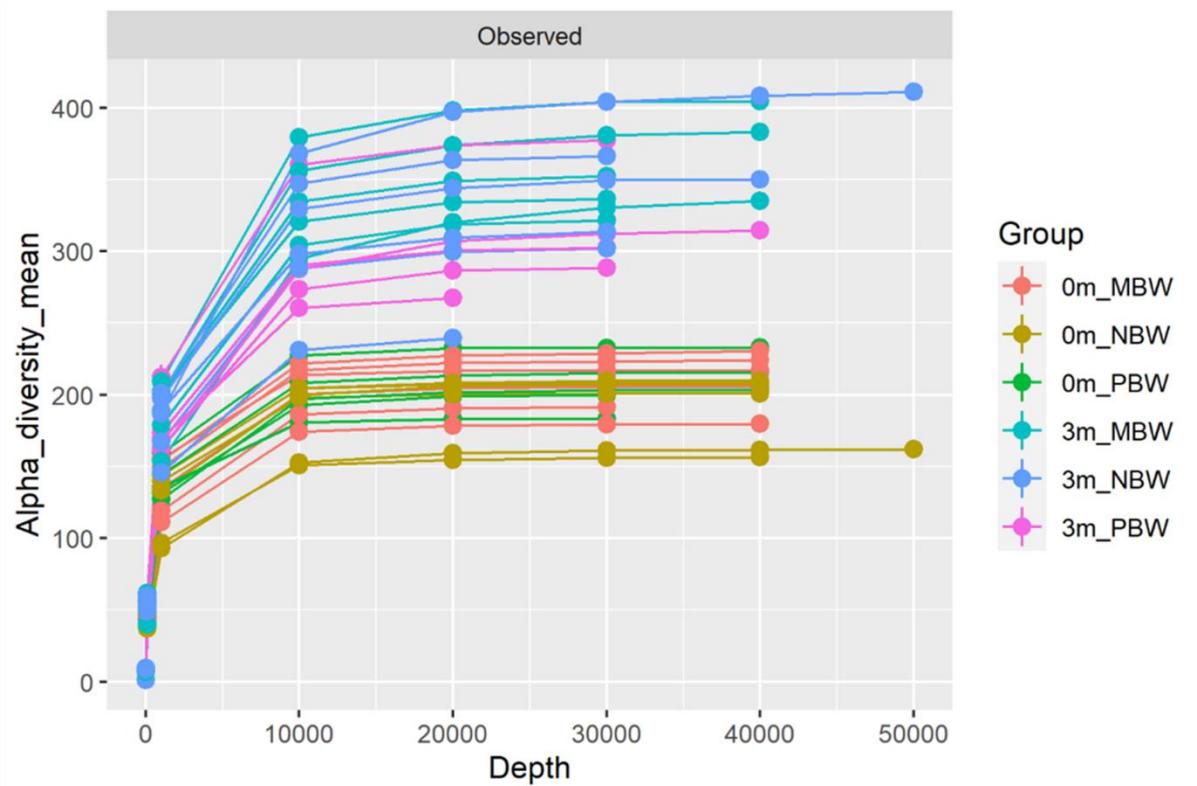

Figure S6. Rarefaction curves of each sample. Rarefaction curve constructed based on observed richness.

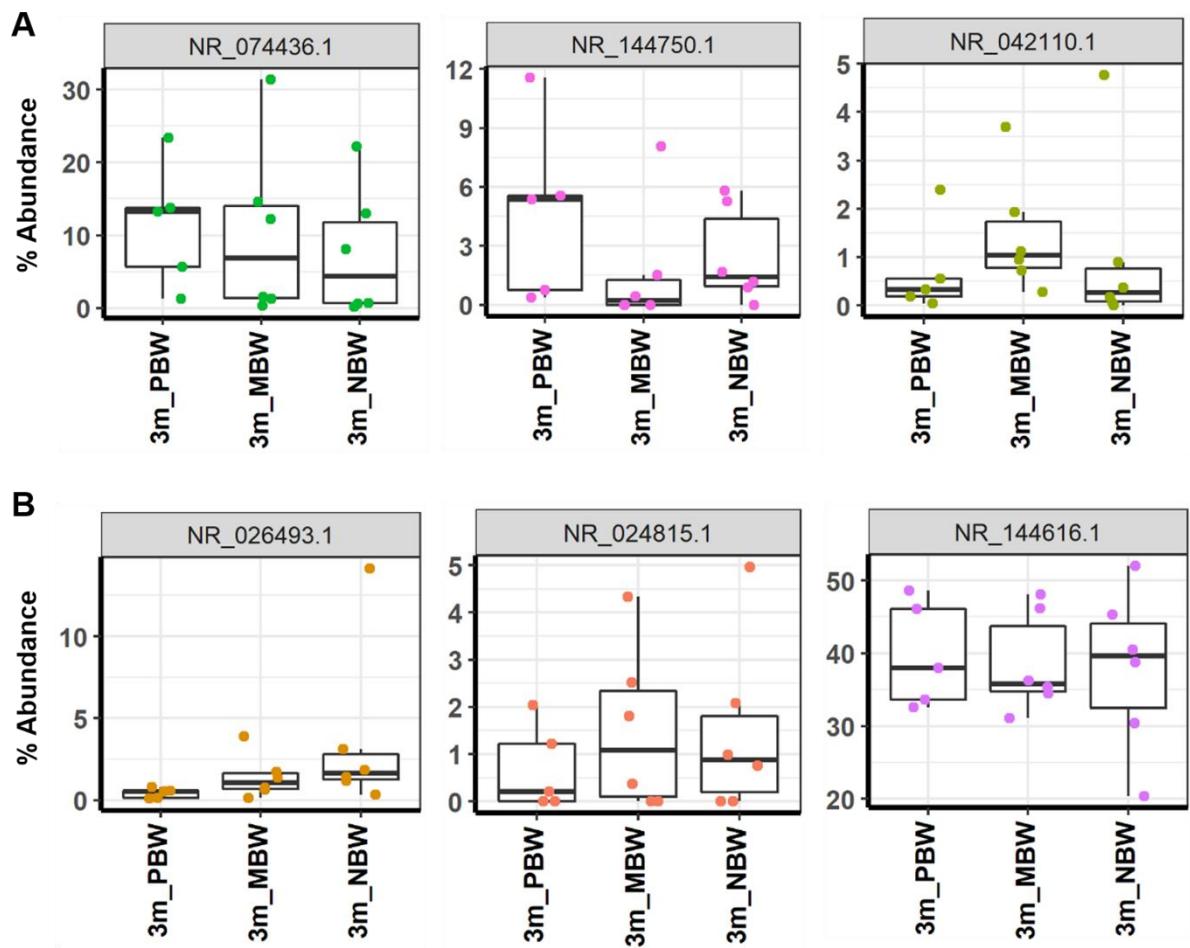

Figure S7. The relative abundance of the top 3 relatively abundant gut microbiota at the species level in PBW and NBW groups from 3 month after gut microbiome replacement.

(A) Relative distribution by sample group of the species more abundant in the PBW group than in the NBW group. (B) Relative distribution by sample group of the species more abundant in the NBW group than in the PBW group.

Table S1. The valid reads of the 16S rRNA amplicon sequence.

| Group | 0m_PBW | 0m_MBW | 0m_NBW | 3m_PBW | 3m_MBW | 3m_NBW |
|-------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| Total reads | 42029 ± 3363 | 43137 ± 1116 | 44629 ± 1727 | 33441 ± 2994 | 40193 ± 2538 | 37144 ± 4007 |

All values are mean ±SEM.OTUs, operational taxonomic units.

Table S2. Comparison of taxonomy abundance at the phylum level.
