Figure S1. Antiviral activity of Ivermectin against BoHV-1. MDBK cells were treated with indicated concentrations of Ivermectin following viral infection at MOI of 1 (A) and 0.1 (B).. Viral titers were determined using plaque assay. The results shown represent the means ±SD (error bars) from three independent experiments. Statistical significance was calculated using Student's *t* test according to $*p < 0.05$, $**p < 0.01$, and $*** p < 0.001$.
