SUPPLEMENTARY APPENDIX

CONTENTS

MATERIALS AND METHODS	3
1. Localisation of <i>A. baumannii</i> , <i>S. pyogenes</i> , <i>S. dysgalactiae</i> , and <i>S. aureus</i> in the scabies mite and in the surrounding human skin.....	3
Figure S1. Testing of the specificity of primary antibodies.....	3
RESULTS	4
1. Assembly and strain-level identification of two complete bacterial genomes from the scabies-associated microbiome of Patient A.....	4
Figure S2. Alignment dot plots	4
Table S1. The 38 contigs of the metagenome-assembled genome MAG-2 blast to <i>A. baumannii</i> genomes in the NCBI nucleotide database.....	9
2. Metabolic pathways analysis using KEGG pathways.....	10
Figure S3. Mapping of the genes and contigs to KEGG pathways.....	10

MATERIALS AND METHODS

1. Localisation of *A. baumannii*, *S. pyogenes*, *S. dysgalactiae*, and *S. aureus* in the scabies mite and in the surrounding human skin

Figure S1. Testing of the specificity of primary antibodies.

Primary antibodies were tested using reference strains, *i.e.* *S. aureus* MSSA CC75 M (a), *A. baumannii* ATCC19606 (b), *S. pyogenes* 2031 Type strain emm1 (c), *S. agalactiae* 18RS21 Type II (d), and *S. dysgalactiae* NS3396 emm-type STG-480 (e). Each bacterial strain was stained with all three primary antibodies, *i.e.* *S. aureus* polyclonal anti-rabbit antibodies (My BioSource) (a), *A. baumannii* polyclonal anti-rabbit antibodies (Life span Biosciences) (b), and *S. pyogenes* polyclonal anti-goat antibodies (My BioSource) (c-e); to ensure that there was no cross-reactivity between each strain. Using the Zeiss 780-NLO confocal microscope no cross-reactivity was seen, and staining of the appropriate bacteria with the appropriate antibody was demonstrated. However, as can be seen in figures 7c-e the Streptococcal antibody was not species specific.

RESULTS

1. Assembly and strain-level identification of two complete bacterial genomes from the scabies-associated microbiome of Patient A

Figure S2. Alignment dot plots.

Reference genomes were selected using the strain-level identification tool PanPhlAn. The figure shows the plots of mapping the metagenome-assembled genome (MAG) contigs onto reference sequences. Each reference sequence is positioned on the x axis, the contigs for the MAG are listed on the Y axis. Each red line represents a contig from a MAG and illustrates the position and orientation of the contig on the reference genome. Plot were generated using MUMMER (version 3.5).

A. Mummer plot of the MAG-2 onto reference sequence of *Acinetobacter baumannii* J9 (NZ_CP041587.1) (sample from Patient A).

C. Mummer plot of MAG-1 onto reference sequence of *S. aureus* (BX571857) (sample from patient B).

D. Mummer plot of MAG-3 onto reference sequence of *Proteus mirabilis* (CP004022_Proteus) (sample from Patient B).

Table S1. The 38 contigs of the metagenome-assembled genome MAG-2 blast to *A. baumannii* genomes in the NCBI nucleotide database.

The *Moraxellaceae*-related metagenome-assembled genome (MAG-2) consisted of 38 contigs with 3,608 predicted genes based on metagenemark prediction. Similarity searches using BLAST to the NCBI nucleotide database revealed that the contigs were highly similar to *A. baumannii* J9 and *A. baumannii* 29FS20 (NZ_CP044519.1).
