

## Supplementary Materials

**Figure S1.** Boxplot showing differences in the median of (a) mean tissue elasticity, (b) Ki-67, (c) fractional anisotropy, (d) mean diffusivity, (e) axial diffusivity, and (f) radial diffusivity, according to histopathology: HGG, high grade glioma; LGG, low grade glioma and meningioma. At the top of each figure, p values for Kruskal-Wallis and post-hoc analysis between group comparisons are presented.

**Figure S2.** Diagrams of collinearity diagnosis before model building. (a) Variance inversion factor (VIF) and (b) eigenvalues calculated for diffusion coefficients.

**Figure S3.** Diagnostic plots of regression models: **(a)** linear, **(b)** logarithmic, **(c)** quadratic polynomial, **(d)** cubic spline. From left to right: normal Q-Q plot, residual vs fitted, spread-location plot and residuals vs leverage.

**Table S1.** Descriptive statistics of tumor regions grouped by histopathologic diagnosis.
