Vaccine-induced T- and B-cell responses differ with respect to Omicron recognition

Franz Mai ¹, Johann Volzke ¹, Emil C. Reisinger ² and Brigitte Müller-Hilke ^{1,*}

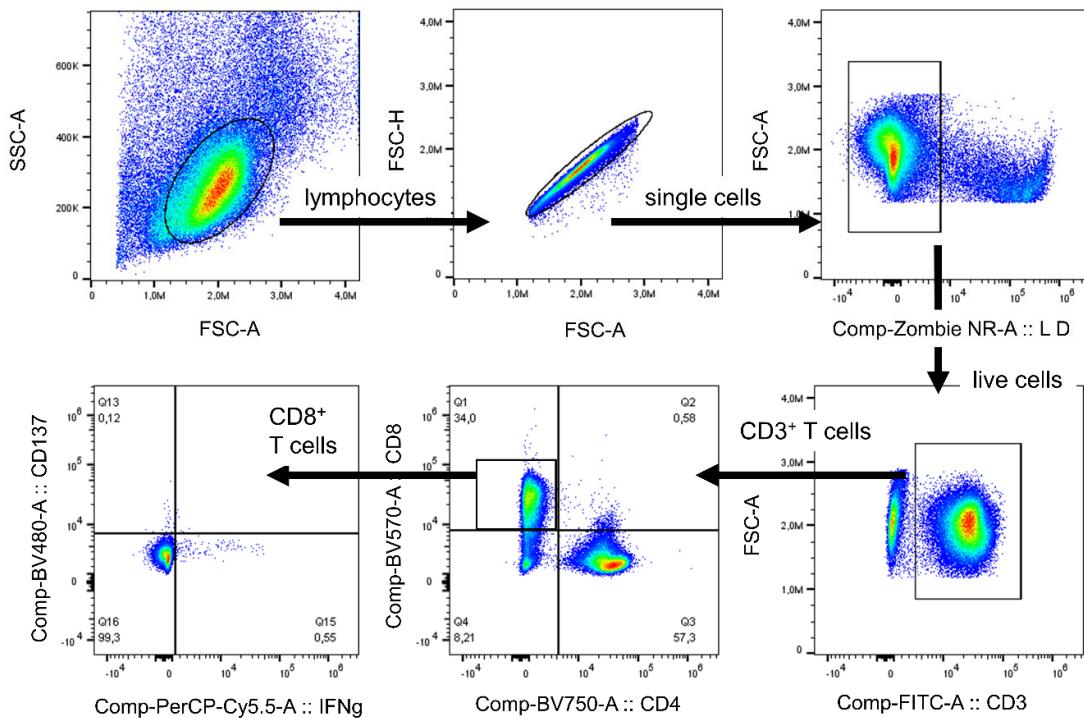

Figure S1. Gating scheme for analyzing T cell responses following BNT162b2 re-stimulation. Arrows indicate hierarchical gating steps.

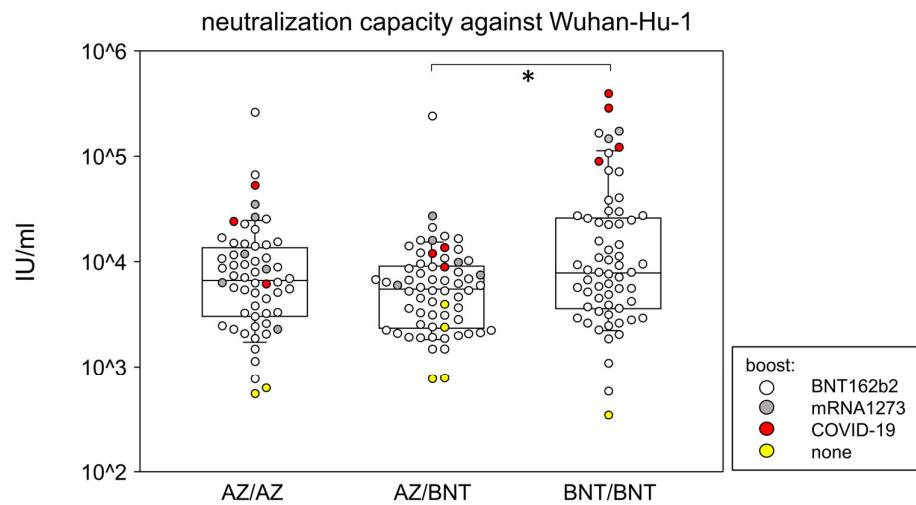

Figure S2. Primary / secondary immunization with BNT162b2 and hybrid immunity led to maximum neutralization capacities against the Wuhan-Hu-1 spike protein. Dot plots and corresponding box plots show neutralization capacities against the Wu-Hu-1 spike protein presented in IU/ml. AZ/AZ: homologous primary/secondary immunization with AZD1222, AZ/BNT: heterologous primary/secondary immunization with AZD1222 and BNT162b2, BNT/BNT: homologous primary/secondary immunization with BNT162b2. Color codes indicate boost variants. Kruskal-Wallis test followed by Dunn's multiple comparison test resulted in a p value of 0.0180, asterisk indicates statistically significant differences.

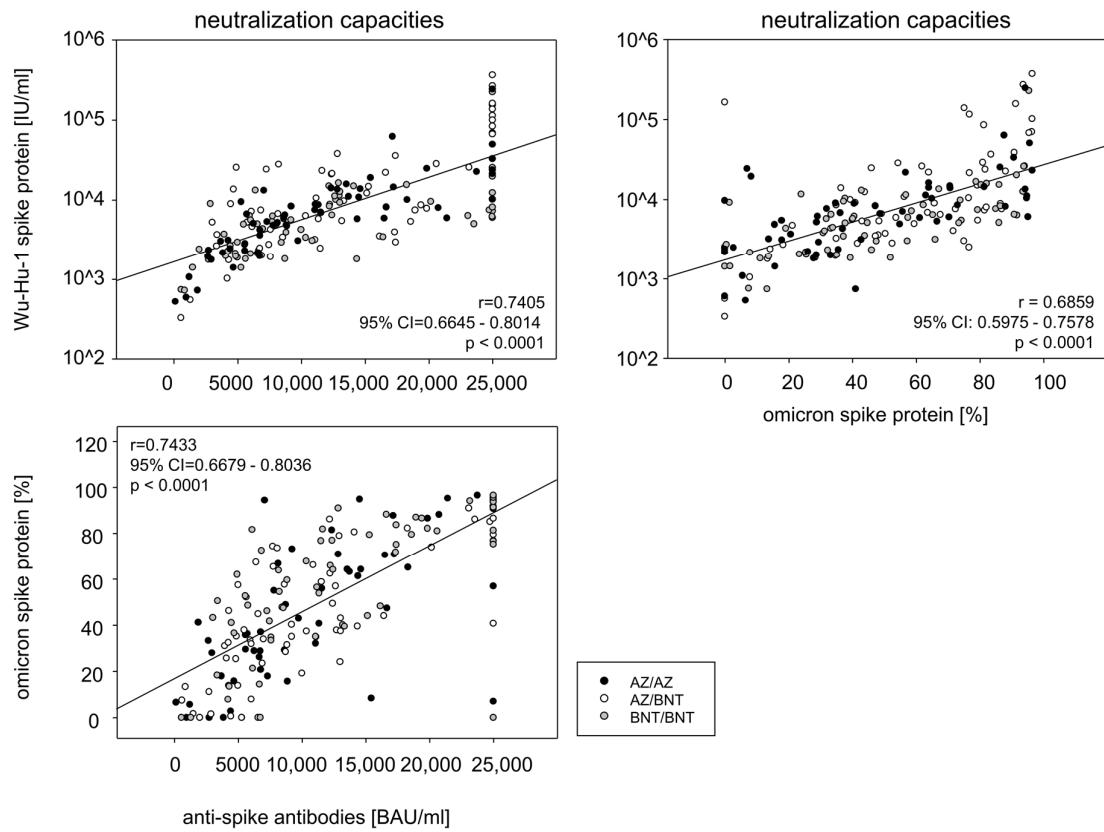

Figure S3. Correlation between antibody concentration and neutralization capacities. Dot blots show the correlation between anti-spike antibody concentrations (BAU/ml) and their neutralization capacities against the wild type (Wu-Hu-1) spike protein (upper left panel) and its Omicron variant (lower left panel) and the correlation between neutralization capacities against Wu-Hu-1 and Omicron (upper right panel). Correlation coefficients (r), 95% confidence intervals (CI) and p values result from Spearman rank correlation analyses. The color scheme indicates vaccination regimen.

Table S1. T cell response to *in vitro* re-stimulation with BNT162b2

Probe	BAU/ml	IU/ml	CD4 ⁺ T helper cells (n/10 ⁶ live PBMC)						CD8 ⁺ cytotoxic T cells (n/10 ⁶ live PBMC)
