## 2 1. Analysis of the Instrumental Time Lag for a Thick Dense SBS Film and an Sbs TFC Membrane

3 SI Figure 1 gives a comparison of the time lag both, permeance, and permselectivity of a thick  
 4 SBS film and a TFC SBS membrane. The trends for membranes are very similar and the small  
 5 difference in the selectivity is probably due to the slightly different properties in bulk and in thin  
 6 films. The virtually constant permeability and selectivity as a function of the sweep flow rate suggest  
 7 that polarization phenomena in the permeate side are negligible, as this would have led to a decrease  
 8 in permeability of the most permeable gas (CO<sub>2</sub>) at the lowest sweep flow rates.

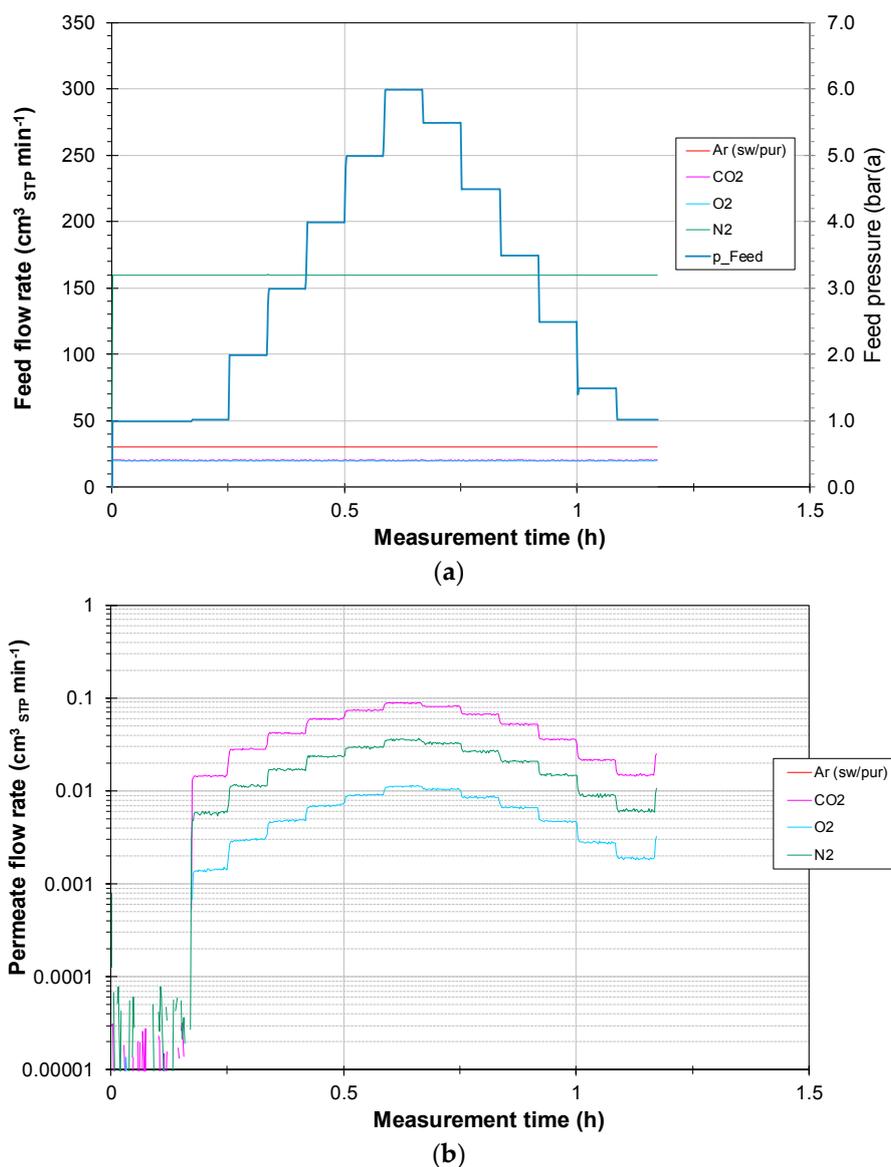

9 **SI Figure 1.** Effect of the sweep flow rate on the time lag (a), the permeances (b), and the  
 10 permselectivity (c) of a fast 5  $\mu\text{m}$  thin film composite membrane (spheres) and a slower 159  $\mu\text{m}$   
 11 thick dense film (diamonds) for the N<sub>2</sub>/O<sub>2</sub>/CO<sub>2</sub> 80/10/10 vol % mixture. Sweeping gas at atmospheric  
 12 pressure.

13 2. Study of the Effect of Slow Pressure Increase on the Instrumental Time Lag

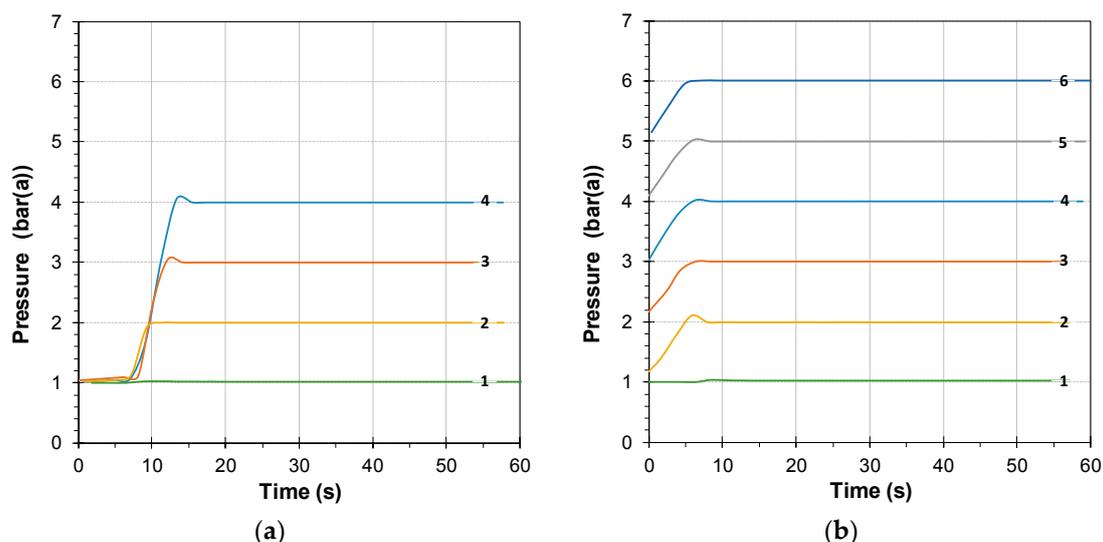

14 SI Figure 2. Increase of the feed pressure upon switching of the six-way feed valve from Argon purge  
 15 to the 80/10/10 vol % N<sub>2</sub>/CO<sub>2</sub>/O<sub>2</sub> mixture (a), corresponding permeation curves for O<sub>2</sub> (b), and  
 16 resulting instrumental time lag (c) determined with an SBS TFC membrane (area 1.77 cm<sup>2</sup>). Feed flow  
 17 rate 200 cm<sup>3</sup>STP min<sup>-1</sup> and sweep flow rate 30 cm<sup>3</sup>STP min<sup>-1</sup>.

18 3. Reaction of the Permeate Composition on Changes in the Feed Pressure

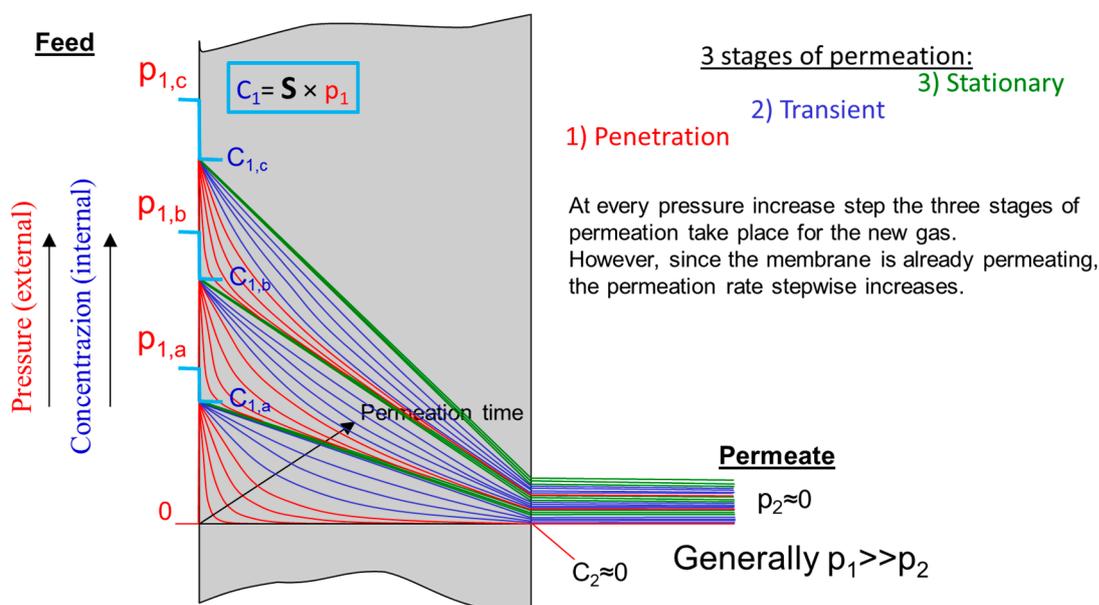

19 SI Fig. 3. Profile of the feed flow rates and feed pressure (a), and the permeate flow rates (b) as a  
 20 function of time for the SBS thin film composite membrane with a 80/10/10 vol % N<sub>2</sub>/CO<sub>2</sub>/O<sub>2</sub> mixture.

21 **4. Mixed Gas Diffusion in the Polymer of Intrinsic Microporosity PIM-SBF-1**

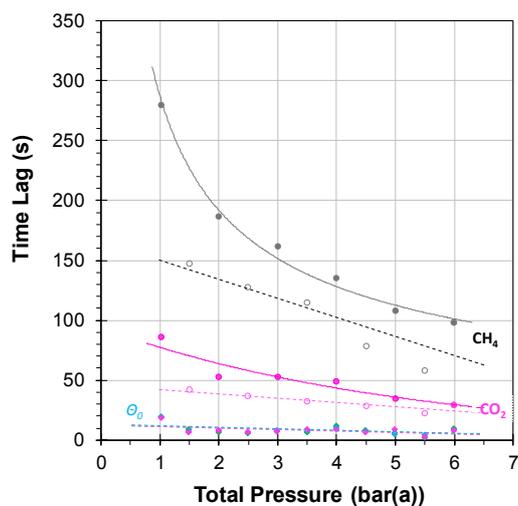

22 **SI Figure 4.** Comparison of the increasing feed pressure as a function of time for individual pressure  
 23 increase ramps (a) and for stepwise increasing pressure (b) for 2088 days aged sample SBF with the  
 24 gas mixture CO<sub>2</sub>/CH<sub>4</sub> 35/65 vol %.

25 **5. Schematic Concentration Profile Development in Three Subsequent Pressure Steps**

26 **SI Figure 5.** Schematic representation of the development of the concentration profiles in the  
 27 membrane after its first exposure to the gas and during two subsequent pressure increase steps.
