### 2.5.7. Particle size and morphology analysis

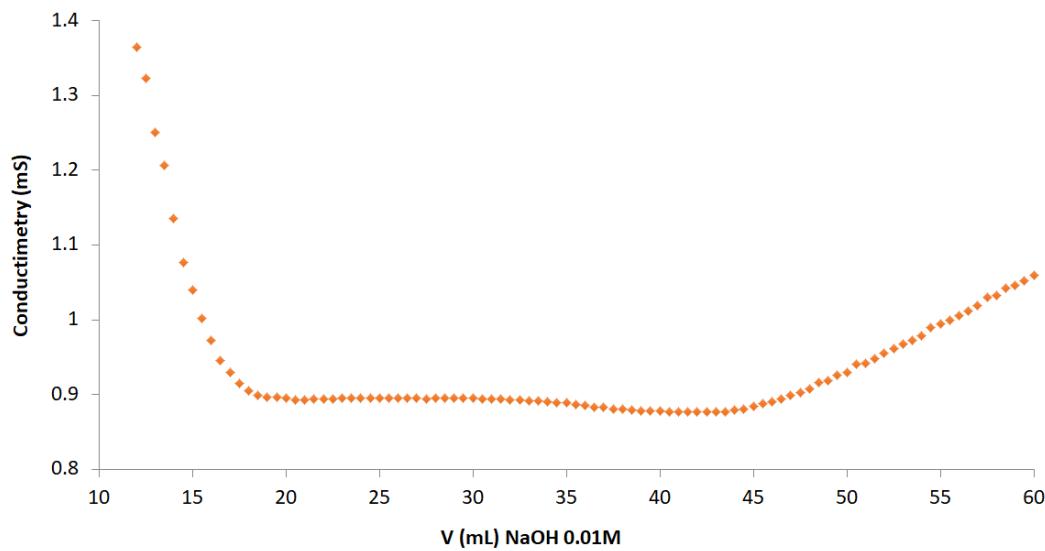

SEM was made with a Hitachi S800 FEG microscope at the “Centre Technologique des Microstructures” (CTμ) at the University of Lyon (Villeurbanne, France). An aqueous suspension of particles was diluted, poured, and dried on a flat steel holder, at room temperature. Finally, samples were sputtered with copper under vacuum. SEM images of the samples were obtained at 15 kV (accelerating voltage).

### 3.1. XRD Analysis

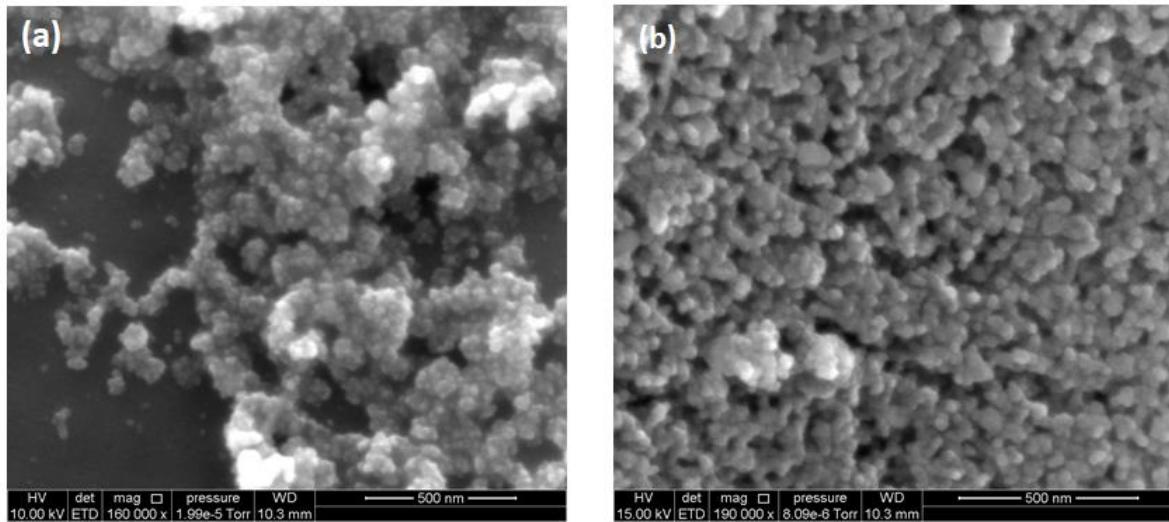

**Figure S1.** XRD spectra of uncoated cobalt ferrite nanoparticles (Sample 1).

### 3.2. Conductometric Analysis of AMD

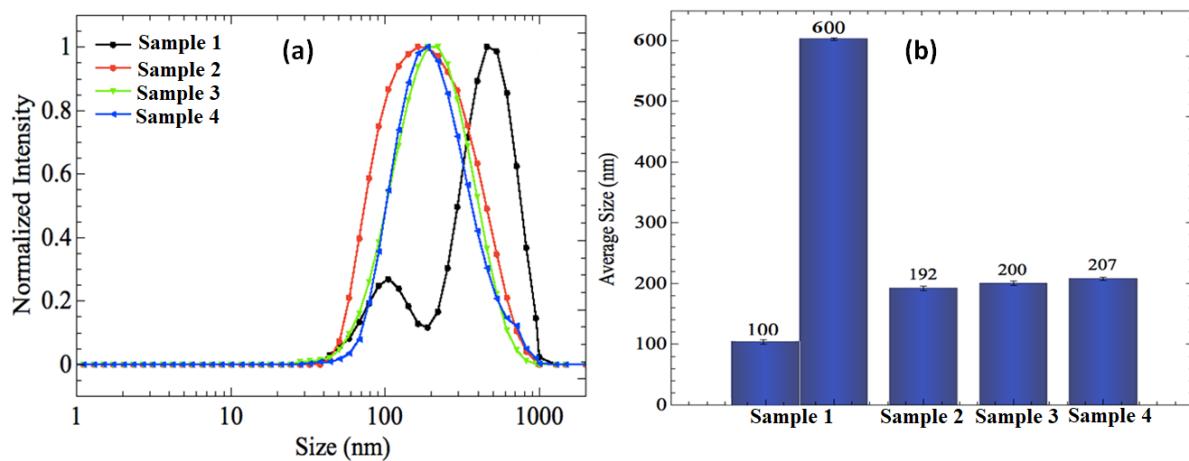

**Figure S2.** Conductometric titration curve of the amino groups of aminodextran.

### 3.5. Size and surface morphology

**Figure S3.** SEM images of coated and uncoated nanoparticles. (a) Sample 1 (b) Sample 4

**Figure S4.** (a) Hydrodynamic size distribution profiles of the synthesized coated and uncoated nanoparticles and (b) Average hydrodynamic size of nanoparticles (Sample 1, 2, 3, and 4) based on intensity weighted data.
