Zones of inhibition (ZoI) of and similar (<20% diameter reduction) to *N. gonorrhoeae* FA19 are highlighted in grey. ZoI highlighted in pink are > 33% smaller than those of *N. gonorrhoeae* FA19, and denote high resistance levels. Intermediate species display ZoI smaller than those of *N. gonorrhoeae* FA19 by 20% to 33% and are highlighted in yellow. The antimicrobial disk measures 6 mm in diameter, which is the minimum ZoI measurable. Species: *Nla*, *N. lactamica*; *Nci*, *N. cinerea*; *Nmu*, *N. mucosa*; *Nel*, *N. elongata*; *Ngo*, *N. gonorrhoeae*

^a *N. gonorrhoeae* FA19 is considered susceptible to most antibiotics presented, used as reference [3].

^b *N. gonorrhoeae* MS11 is considered highly resistant to streptomycin [4].

^c *N. gonorrhoeae* F89 is considered highly resistant to cefixime and ceftriaxone [5].

^d *N. gonorrhoeae* H041 is considered highly resistant to ceftriaxone [6].

Table S2: Commensal *Neisseria* minimal inhibitory concentrations (MIC, µg/mL) to antibiotics (penicillin, azithromycin, ceftriaxone, erythromycin, chloramphenicol, gentamicin).
