Values are presented as means ± SD (n=9). P-values from two-way and one-way ANOVA ($p \leq 0.05$). If interaction was significant, Tukey post hoc test was used to identify differences in the experimental treatments. Different capital letters stand for significant differences between the two stimuli. Low case letters represent differences among sampling time. Different symbols indicate significant differences between i.p. injected and undisturbed fish.

Values are presented as means ± SD (n=9). P-values from two-way and one-way ANOVA ($p \leq 0.05$). If interaction was significant, Tukey post hoc test was used to identify differences in the experimental treatments. Different capital letters stand for significant differences among sampling time. Low case letters represent differences between the two stimuli. Different symbols indicate significant differences between i.p. injected and undisturbed fish.
