

Figure S1. Log-likelihood as a function of exponent c at 5-30 m across all individuals at sapling and adult life stages. Each point on curve_{mean} (black point) is the average value of the log-likelihood at 5-30 m at a certain c .

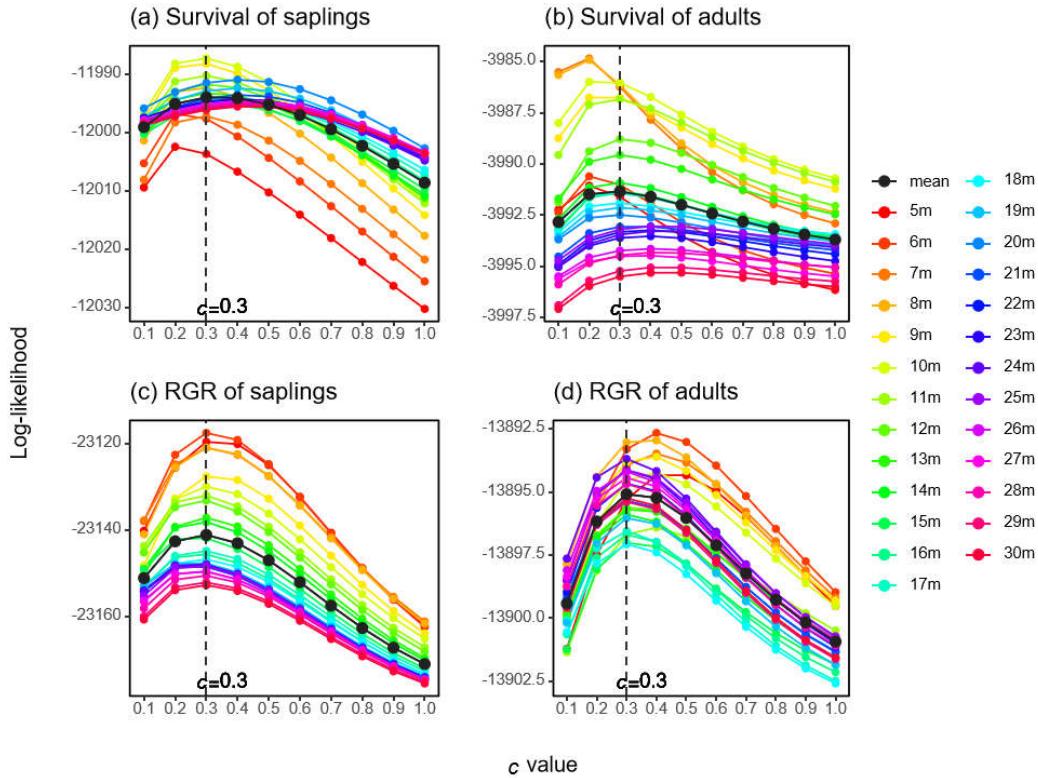

Figure S2. Log-likelihood as a function of exponent c at 5-30 m in different tree mycorrhizal types at sapling and adult life stages. Each point on curve_{mean} (black point) is the average value of the log-likelihood at 5-30 m at a certain c .

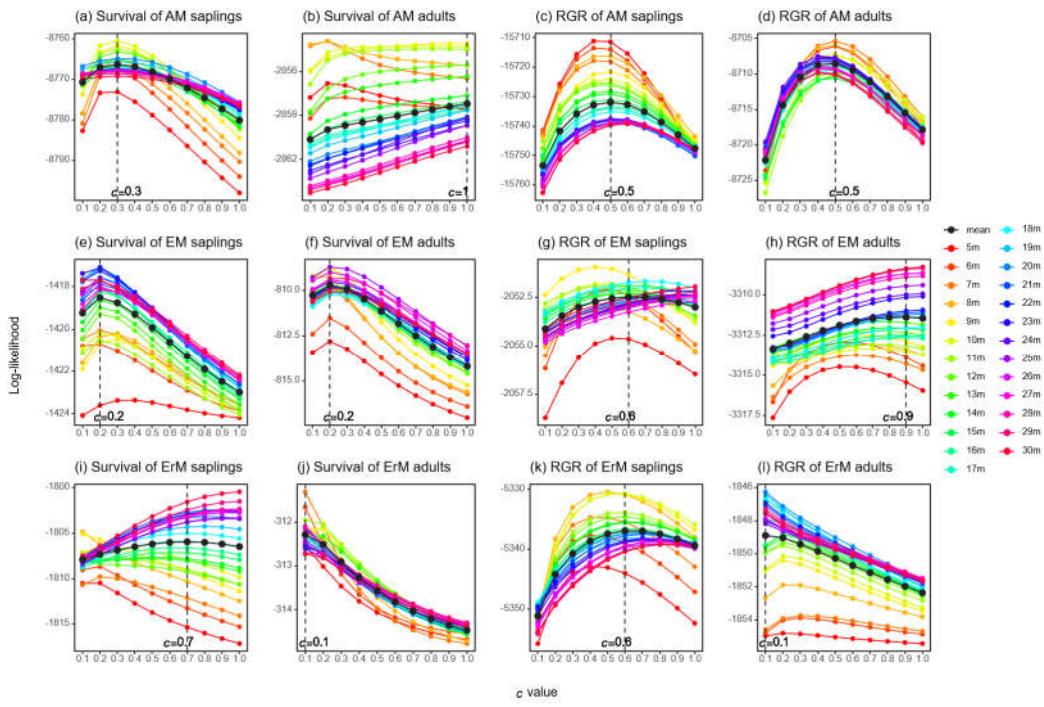

Figure S3. Estimates ($\pm 2\text{SE}$) of neighborhood factors on survival (a) and RGR (b) of all individuals at sapling and adult life stages at 5–30 m. Solid circles indicate significant effects ($P < 0.05$), while open circles indicate non-significant effects. Con, conspecific density; HetAM, heterospecific AM density; HetEcM, heterospecific EcM density; HetErM, heterospecific ErM density.

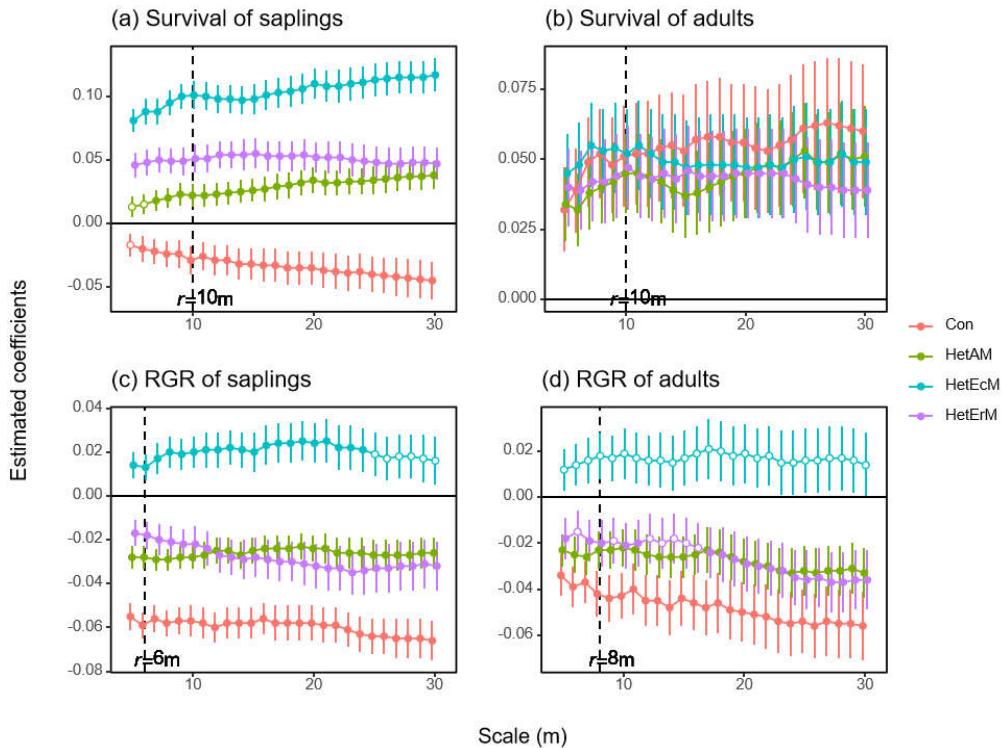

Figure S4. Estimated effects ($\pm 2\text{SE}$) of neighborhood factors on survival and RGR of tree mycorrhizal types at sapling and adult life stages at 5-30 m. Solid circles indicate significant effects ($P < 0.05$), while open circles indicate non-significant effects. Con, conspecific density; HetAM, heterospecific AM density; HetEcM, heterospecific EcM density; HetErM, heterospecific ErM density.

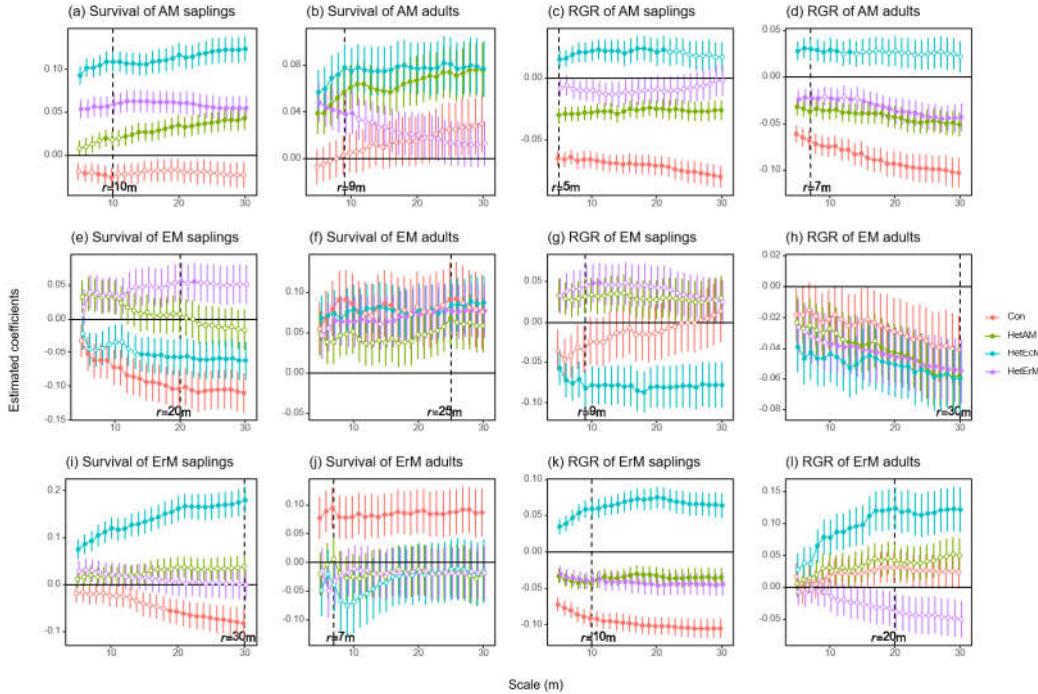

Figure S5. Correlations between BA of EcM species (BA_{EcM}) and BA of AM species (BA_{AM}) with species diversity (H , Shannon-Weiner index) (a & e), average RGR (b & f), total BA (c & g) and increment of total BA (d & h).

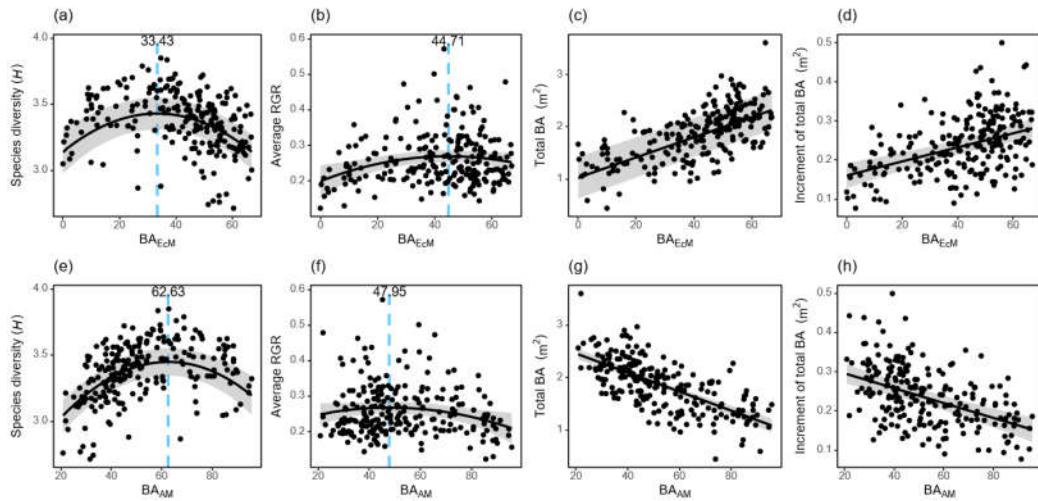

Table S1. 179 focal species used in the analysis of neighborhood effects on survival and growth.
 (Life form: C=canopy tree species, U=understory tree species, and S=shrub species) in subtropical evergreen broad-leaved forest in Wuyanling National Natural Reserve, Zhejiang, China.

Table S2. Optimal scales and *c* for survival and relative growth rate (RGR) of all individuals and tree mycorrhizal types at sapling and adult life stages at 5–30m.

		<i>c</i>		Scale (m)	
		Sapling	Adult	Sapling	Adult
Survival	All individuals	0.3	0.3	10	10
	AM tree species	0.3	1.0	10	9
	EcM tree species	0.2	0.2	20	25
RGR	ErM tree species	0.7	0.1	30	28
	All individuals	0.3	0.3	6	8
	AM tree species	0.5	0.5	5	7
	EcM tree species	0.7	0.9	9	30
	ErM tree species	0.6	0.1	10	19

Table S3. Coefficient estimates of the correlation between BA_{EcM} and BA_{AM} with species diversity, average RGR, total BA and increment of total BA. BA, basal area; BA_{EcM} , BA of EcM tree species; BA_{AM} , BA of AM tree species; RGR, relative growth rates.

Response variable	Explanatory variable	Estimates	SE.	P
Species diversity	BA_{EcM}	0.017	0.003	0.000
	BA_{EcM}^2	0.000	0.000	0.000
Average RGR	BA_{EcM}	0.003	0.001	0.006
	BA_{EcM}^2	0.000	0.000	0.013
Total BA	BA_{EcM}	0.019	0.002	0.000
Increment of total BA	BA_{EcM}	0.002	0.000	0.000
Species diversity	BA_{AM}	0.029	0.003	0.000
	BA_{AM}^2	0.000	0.000	0.000
Average RGR	BA_{AM}	0.002	0.001	0.082
	BA_{AM}^2	0.000	0.000	0.040
Total BA	BA_{AM}	-0.018	0.001	0.000
Increment of total BA	BA_{AM}	-0.002	0.000	0.000

Table S4. Coefficient estimates of the correlation between the square root of RE_A ($\sqrt{RE_A}$) with species diversity, average RGR, total BA and increment of total BA. RGR, relative growth rates; BA, basal area; RE_A , the ratio of BA of EcM to BA of AM tree species.

Response variable	Explanatory variable	Estimates	SE.	P
Species diversity	$\sqrt{RE_A}$	0.685	0.142	0.000
	RE_A	-0.447	0.070	0.000
Average RGR	$\sqrt{RE_A}$	0.143	0.055	0.009
	RE_A	-0.066	0.027	0.016
Total BA	RE_A	0.903	0.074	0.000
Increment of total BA	RE_A	0.092	0.014	0.000
