

Supplementary Materials for

A Study on the Combination of Enzyme Stabilizers and Low Temperatures in the Long-Term Storage of Glutamate Biosensor

Andra Bacciu ¹, Paola Arrigo ¹, Rossana Migheli ¹, Alessandra Tiziana Peana ², Gaia Rocchitta ^{1,*} and Pier Andrea Serra ¹

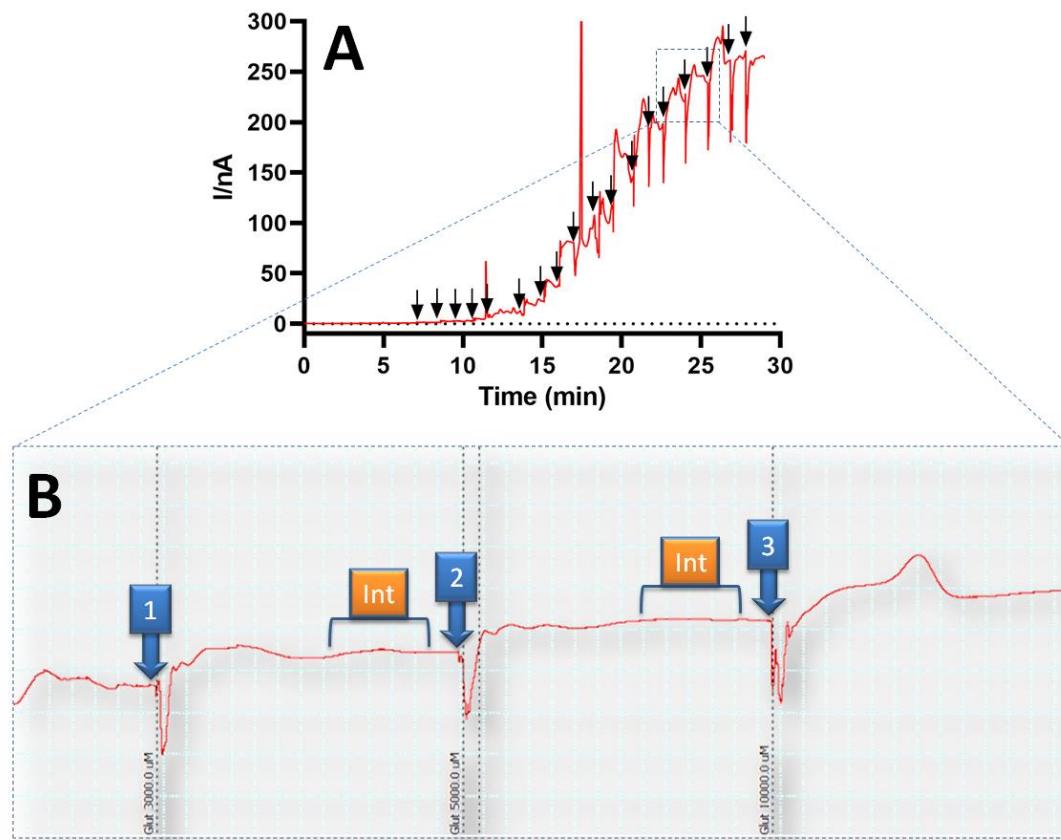

Figure S1. Illustrative plot that reports the raw currents derived from the calibration of a biosensor belonging to the control group (Ptc/PPD/PEI(1%)₂/GlutOx5) on Day 56, from 0 to 50,000 μ M concentration. Rows indicate the injections of the Glut stock solution corresponding to concentrations of 1, 2, 4, 10, 20, 50, 100, 200, 400, 600, 1000, 1500, 2000, 3000, 5000, 10,000, 20,000, and 50,000 μ M.

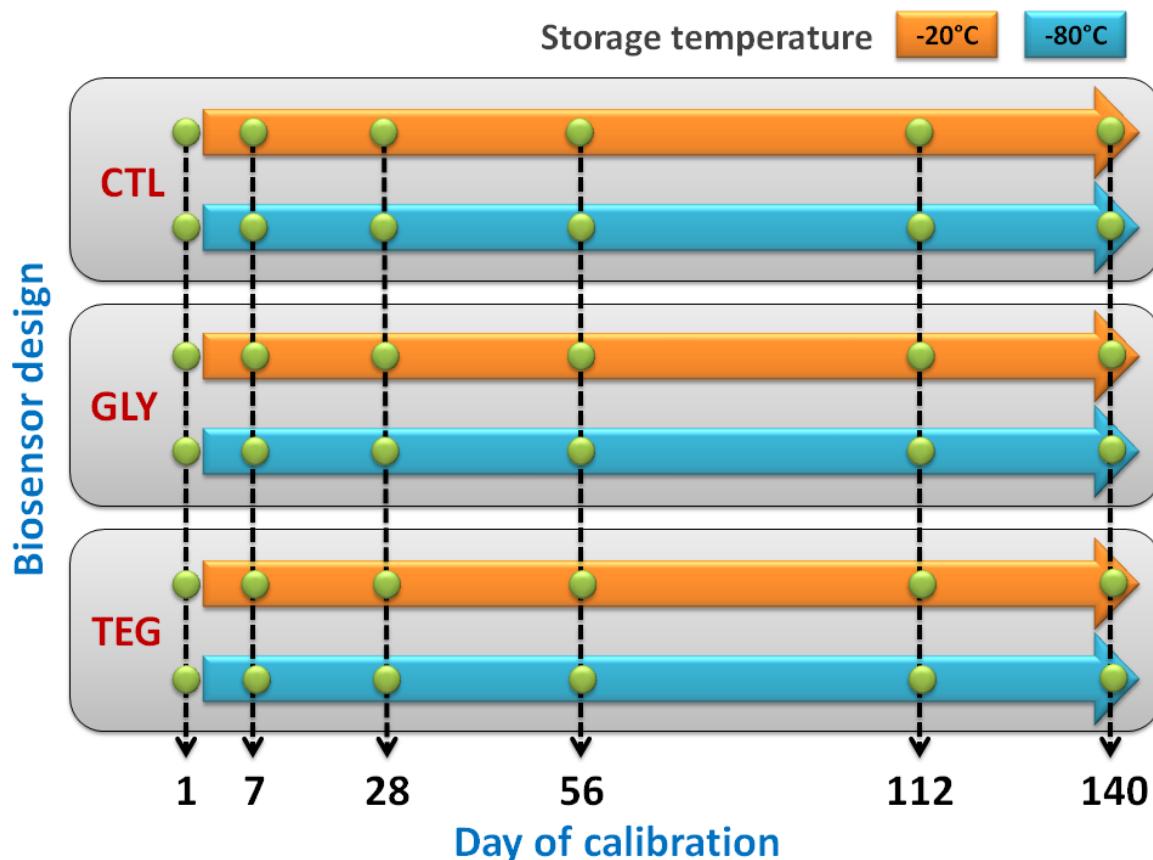

Figure S2. Schematic representation of the timeline of the experimental protocol. The biosensors were calibrated on Day 1 after RT over-night stabilization, with a range of concentration between 0 and 50,000 μM by means of injections of Glut stock solution (10 mM and 1 M). The same protocol was repeated on Day 7, Day 28, Day 56, Day 112, and Day 140 (for a total of 5 months) (green rings). The three different groups (Control, GLY, and TEG) were subjected to 6 calibrations each. After each calibration, each biosensor group was stored at two different temperatures, i.e., -20°C (orange rows) and -80°C (blue rows).

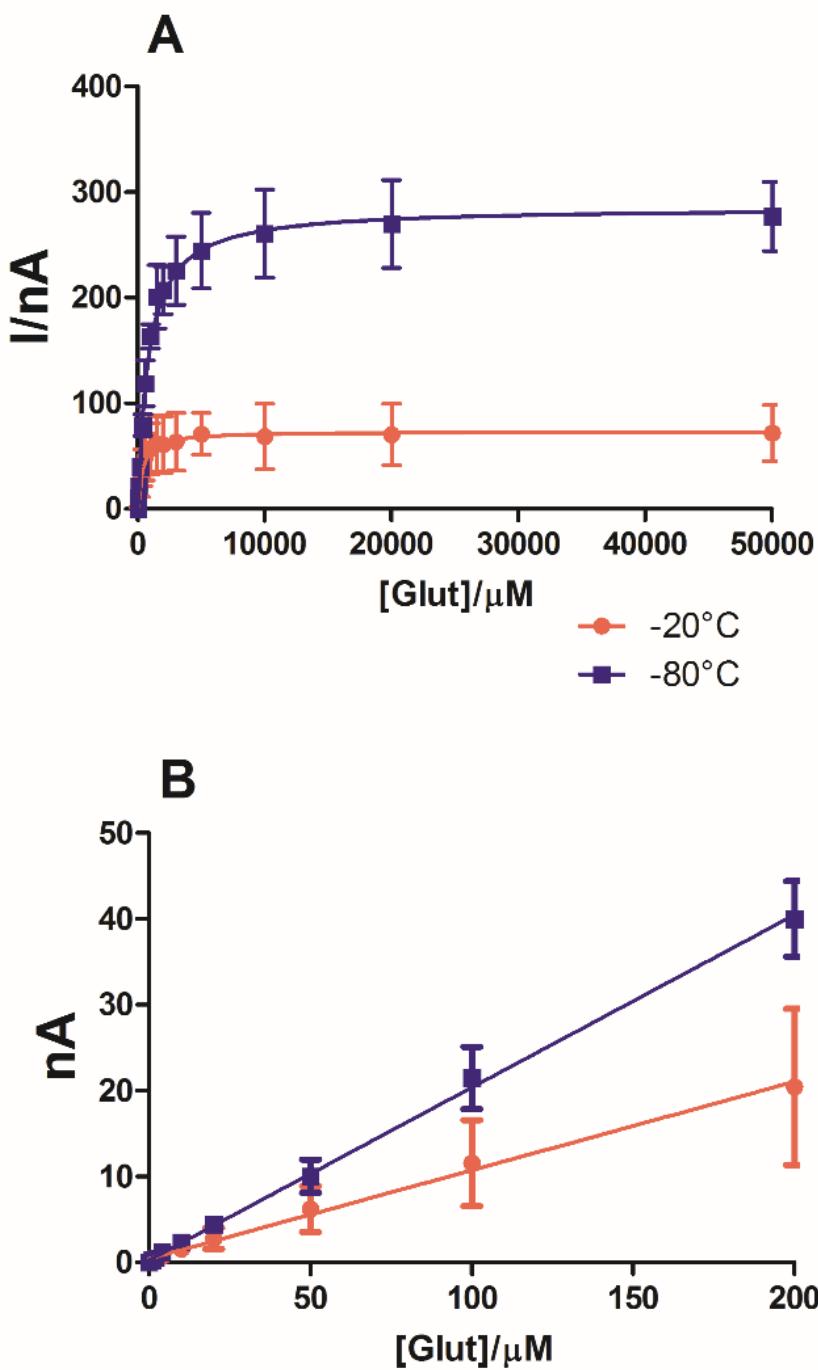

Pt_c/PPD/PEI(1%)₂/GlutOx₅

Figure S3. Representative calibration plots of the control group (Pt_c/PPD/PEI(1%)₂/GlutOx₅) on Day 56 for biosensors ($n = 4$) stored at $-20^\circ C$ (blue plot) and $-80^\circ C$ (red plot). Panel A: Michaelis–Menten graph for a concentration range of 0–50,000 μM . Panel B: Linear regression graph in a concentration range of 0–200 μM . Concentration steps for calibrations were 1, 2, 4, 10, 20, 50, 100, 200, 400, 600, 1000, 1500, 2000, 3000, 5000, 10,000, 20,000, and 50,000 μM .
