Legends to Tables S1 to S4

and Tables S3 and S4 itself

Table S1 and Table S2 itself –

at the end of Supplementary Materials (due to big volume)

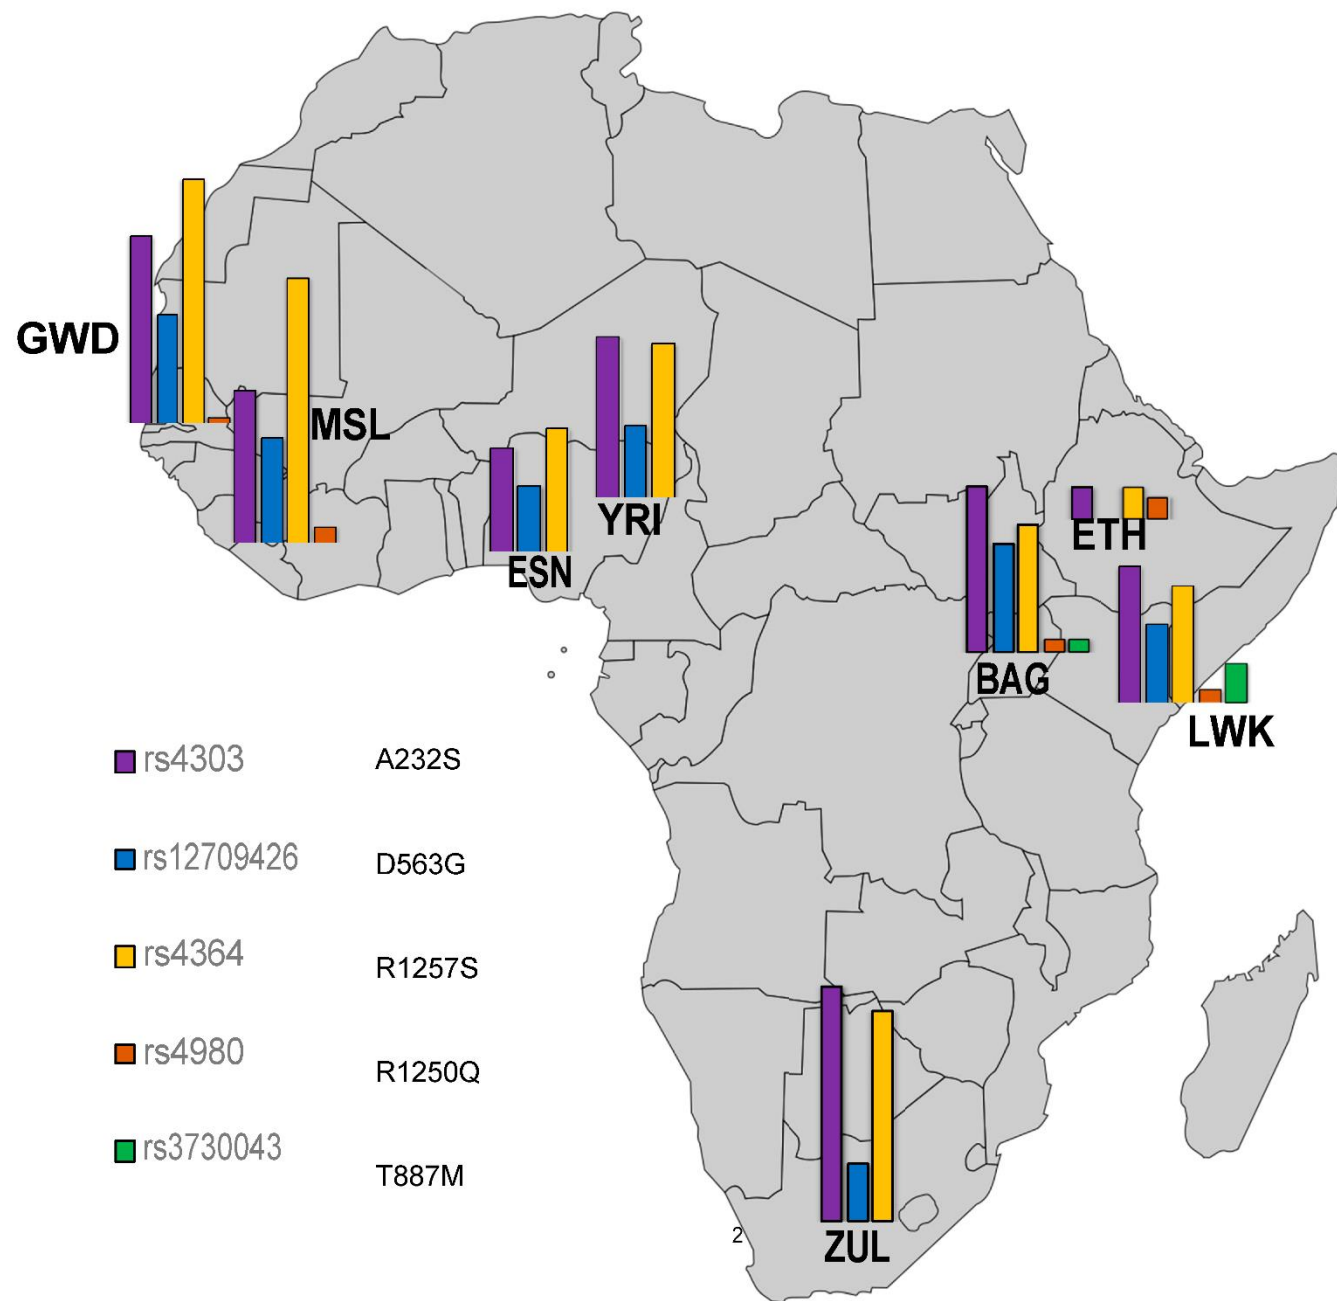

Figure S1

Figure S2

% of a particular distance occurs during the simulation

Figure S3

Figure S1. Allele frequencies of select ACE variants within African populations.

ESN: Esan in Nigeria; GWD: Gambian in Western Division, Mandinka; LWK: Luhya in Webuye, Kenya; MSL: Mende in Sierra Leone; YRI: Yoruba in Ibadan, Nigeria
BAG: Baganda from Uganda; ETH: Amhara, Oromo, Somali and Gumuz from Ethiopia; ZUL: Zulu from South Africa

Figure S2. Correlation of blood ACE levels with different ACE mutations found in Iceland.

Correlations of blood ACE levels - from SomaScan assay [48], for each mostly missense ACE mutations found in this cohort of 35,559 Icelanders (from Table S4-GWAS summary statistics [48]) was presented as beta values (The beta of the variant/trait association) with their SE values.

At least carriers of three missense ACE mutations (G16R, Y215C and R453P) demonstrated dramatic drop in blood ACE levels (red bars) and another two ACE mutations (N276L and G984S)-demonstrated significant decrease in blood ACE levels (black bars).

Figure S3. Distances between Q1225 and R1275 in WT ACE and both ACE mutants.

A representative example of the analysis of the distances between Q1225 and R1275 in WT ACE and both ACE mutants (R1250Q and R1257S) during the simulation.

X axis -distances between residues Q1225 and R1275 during the simulation;

Y-axis- how much time (in %) a particular distance occurs during the simulation.

Table S1. Analysis of missense ACE mutations in the available databases.

List of 1,143 known coding non-synonymous single-nucleotide genetic variants (nsSNVs) in the ACE gene (ENST00000290866, GRCh38/hg38 genome assembly), for which minor allele frequencies (MAF) were determined from the population data: dbSNP MAF presented for each individual variant was the highest among 26 sequencing projects comprising missense variants in the ACE gene found in the dbSNP database [13] (<https://www.ncbi.nlm.nih.gov/projects/SNP/snp>) (build 155). For comparison, we also included minor allele frequencies obtained from the gnomAD v2.1.1 exome dataset, when present. Functional predictions and scores from four different *in silico* tools - PolyPhen-2 [15], SIFT4G [16], VEST4 [17] and REVEL [18] are included and majority vote predictions (Benign/Damaging) added for cases where more than two of the tools independently deliver the same prediction.

Polyphen2: PolyPhen-2 (dbNSFP version 3.3a) annotation based on HumanVar database. This annotation should be used when evaluating rare alleles at loci potentially involved in complex phenotypes, dense mapping of regions identified by genome-wide association studies, and analysis of natural selection from sequence data. The annotation consists of score and categorical prediction. There are three possible predictions: **D** (**Probably** damaging, score \geq 0.909), **P** (**possibly** damaging, 0.446 \leq score \leq 0.908), B (benign, score \leq 0.445).

SIFT4G: mutation considered damaging if score is less than 0.5.

VEST4 and **REVEL:** mutation considered damaging if score is more than 0.5.

Majority of the missense variants in ACE gene lack any known disease association and a few variants found in the ClinVar [19] database (77 variants) are annotated either as Benign/Likely benign (23) or as variants of unknown significance (54).

Table S2. All ACE mutations classified according to PolyPhen-2 scores.

Name of the ACE mutations (column 3), that were already confirmed as LoF, were marked with red.

^a Japanese; ^b Mutations, eliminating transmembrane anchor, i.e. increasing (>10-fold) blood ACE, and thus, decreasing tissue ACE; ^c mostly African; ^d frequent in Netherlands;

Frequency of mutations (MAF, column 6): >10-**bold**, >100-**red**, >1000-**bold red**.

Blood ACE levels (column 7) is expressed as % of mean in population.

Polyphen2: PolyPhen-2 (dbNSFP version 3.3a) annotation based on HumanVar database. This annotation should be used when evaluating rare alleles at loci potentially involved in complex phenotypes, dense mapping of regions identified by genome-wide association studies, and analysis of natural selection from sequence data. The annotation consists of score and categorical prediction. There are three possible predictions: **D** (**Probably** damaging, score \geq 0.909), **P** (**possibly** damaging, 0.446 \leq score \leq 0.908), **B** (benign, score \leq 0.445).

Table S4. GWAS summary statistics for blood ACE levels with different ACE mutations.

Plasma protein levels with SomaScan multiplex aptamer assay was measured for 4,719 proteins, including ACE, in 35,559 Icelanders with genotype and phenotype information [48]. Authors (and deCODE Genetics) made available the full GWAS summary statistics for each protein from this study including ACE (<https://download.decode.is/form/folder/proteomics>)

We excerpted these GWAS statistics for ACE (correlation of blood ACE levels with some ACE mutations-beta value) and added Mean Allele Frequency for each mostly missense ACE mutations found in Iceland cohort and Mean Allele Frequency in general population (TOPMED with 264,690 participants)- in order to compare with frequency distribution of a given ACE mutation in Iceland. Those ACE mutations, which frequency in Iceland was more than 10-fold higher than in TOPMED cohort, were highlighted with green and their frequencies were highlighted with red. Those mutations which frequencies were several folds lower in Iceland were highlighted with yellow. Note ACE mutation K346R (rs778168348) highlighted with magenta, which is pretty endemic for Iceland, because MAF for this mutation in Iceland was more than 1000-fold higher than for general population -TOPMED cohort. We also added the correct name of each mutation using mature ACE numbering and ACE domain localization (N or C) and calculated amounts of subject with these ACE mutations in this cohort of 35, 559 Icelanders.

Table S2

III. Combined frequency		
Probably damaging (red)	3,854	
Possibly damaging (violet)	1,700	
Probably damaging and possibly damaging combined	5,554	
Benign	4,871	
All (MAF)	10,425	

Name of the ACE mutations (column 3), that were already confirmed as LoF, were marked with **red**.

^a Japanese; ^b Mutations, eliminating transmembrane anchor, i.e. increasing (>10-fold) blood ACE, and thus, decreasing tissue ACE; ^c mostly African; ^d much more frequent in Netherlands [18];

Frequency of mutations (MAF, column 6): >10-**bold**, >100-**red**, >1000-**bold red**.

Blood ACE levels (column 7) is expressed as % of mean in population.

Polyphen2: PolyPhen 2 (dbNSFP version 3.3a) annotation based on HumanVar database. This annotation should be used when evaluating rare alleles at loci potentially involved in complex phenotypes, dense mapping of regions identified by genome-wide association studies, and analysis of natural selection from sequence data. The annotation consists of score and categorical prediction. There are three possible predictions: **D** (**Probably damaging, score**≥0.909), **P** (**possibly damaging,**
