

Table S1. Scale to assess the satisfaction through the session.

To which game have you played? \_\_\_\_\_

How many points/cards have you earned at the end of the game? \_\_\_\_\_

Which score do you give to this game? Please, mark one option

| 1           | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10           |
|-------------|---|---|---|---|---|---|---|---|--------------|
| Very<br>bad |   |   |   |   |   |   |   |   | Very<br>good |

How have you been playing?

Very bad

Bad

Regular

Good

Very good

Table S2. Brief explanation of the games used and justification of the main cognitive process active when playing.

| Board game                                  | Description of the game dynamic   | Main cognitive process     |
|---|---|----------------------------|
| <b>GAMES USED IN THE EXPERIMENTAL GROUP</b> |   |                            |
| Bee Alert [2]                               | A series of colored bees are hidden under their hives. Players must memorize their starting position. Bees, under their hives, move through the game space according to specific cards. When the bees move, the players need to erase from their memory the initial position and update it in the memory  | Updating                   |
| Jungle Speed [41]                           | A wooden totem is in the middle of the table. All the cards are distributed to the players. In turns, players face up the cards. When two cards with exactly the same symbol appear, the first person to take the wooden totem wins. The symbols are very similar, so sometimes players need to inhibit the automatic action of taking the totem when they notice that the two symbols are not really the same. In addition, there are some cards that request all the players to do different actions, activating cognitive shifting.  | Inhibition and flexibility |
| Ghost Blitz [42]                            | Five wooden objects are placed in the middle of the table. All the cards are distributed to the players. In turns, players face up the cards. In each card, two objects with two colours are depicted. However, there are two types of cards. In one type, one of the objects matches the figure and color exactly to one object in the middle of the table. The first person to take the correct object, wins the card. The secon type of card consists in a combination of the shapes and colors that doesn't match any object. But always one of the five objects is not represented in the card, neither by the shape nor by the color. Then, the first player to take this object, wins the card. Then, all the people is switching between the two types of cards. In addition, sometimes the players need to inhibit the automatic action of taking one object when they notice that they are mistaking. | Inhibition and flexibility |
| Dejà Vu [43]                                | Different cardboard tokens are laid on the table. One player begin to flip cards, hiding one on the previous one (only one is faced up in each round). Images of the cardboard tokens are depicted in each card (from two to five images). When one player thinks that one object have appeared the second time, he/she takes the token from the center of the table. In this game you need to update constantly the images that are your memory to decide whether it is the first time you see them or is the secon time.  | Updating                   |
| <b>GAMES USED IN THE CONTROL GROUP</b>      |   |                            |
| Dixit [44]                                  | In each round, one person is a "storyteller". He/she select one card from their hand and, without showing the image depicted to the rest of players, he/she makes up a sentence. Then, the other players select one card from their hands that they thinks could fit to the description heard. The storyteller shuffles all the cards and put them face up in a raw and the rest of players try to guess which card was the chosen one by the storyteller.  | Theory of mind             |

---

|                  |   |                            |
|------------------|---|----------------------------|
|                  | Depending on the hits and mistakes, all the players score points. To win in this game, every player needs to discern whether the rest of players will select their cards or not without asking directly to them.  |                            |
| Mixmo [45]       | Letter tiles are placed in the middle of the table face down. Each player takes six of them. When the game begins all the players turn their tiles and try to make words linked by one letter. When one player uses all the letter, he/she says Mixmo and every player takes two more tiles. So, the game consists on making words very fast.   | Verbal fluency             |
| Story Cubes [46] | There are some dice with figures in their faces. In each player turn, he/she throw all of them and explains a story relating all the dice.  | Verbal fluency             |
| Mmm! [47]        | A board with 19 pieces of food of two to four squares are sketched. In each turn, the player roll three dice with the food depicted in each face. In every roll, the player must place at least one die in a food of the board that matches the face of the roll. After three rolls, if the player cannot place the three dice, he/she loose the opportunity of filling the board squares giving a penalty to all the players. In this game is very important to know when is a good moment to take risks and when is better not to reroll. | Decision-making under risk |

Note. The main cognitive process active when playing, was estimated before applying the games in the intervention by two senior researchers according to the dynamics of the game.

Table S3. Latent Class Analysis of the evolution in playing each game.
