

Figure S1:

Comparison of cNfL levels of the meningitis patients (n = 10) with the group of all febrile non-meningitis children (n = 10; complex febrile seizure + febrile infection). There was no significant difference between cNfL levels in children with meningitis (median 120.5 pg/mL; range 58.1-205.4 pg/mL) and febrile non-meningitis children (median 72.5 pg/ml; range 53.3-210.8; p = 0.14).
