p values mentioned are pairwise p values except for age which was not categorical but continuous

Covariates forced into the model were creatinine, BMI, matrix (morning & spot urine); for combined studies also country was forced into the model.

OR= exp (Beta)

*: LOQ set at 0.1 µg/L

**: Country specific

Note that if a trend was observed in the data and the distribution of participants was unequal over different categories or the number of participants was small for certain categories, a combination of categories was taken. Here results are displayed as observed in the original questionnaire.

Not all studied exposure determinants are listed in the table above; Most relevant were chosen.

Table S2. Logistic regression for urinary concentrations of AMPA by some potential exposure determinants, subgroups of the participants stratified for individual characteristics, dietary preferences, exposure relevant behaviour and sociodemographic information.

p values mentioned are pairwise p values except for age which was not categorical but continuous

Covariates forced into the model were creatinine, BMI, matrix (morning & spot urine)

OR= exp (Beta)

*: LOQ was set at 0.1 µg/L. Study 3XG was not taken into account here seeing the LOQ in that study was already 0.2 µg/L.

**: Country specific

Note that if a trend was observed in the data and the distribution of participants was unequal over different categories or the number of participants was small for certain categories, a combination of categories was taken. Here results are displayed as observed in the original questionnaire.

Not all studied exposure determinants are listed in the table above; Most relevant were chosen.
