Figure S1: Unprocessed SEM images of Au NRs. Images are given as an example (many more images were used for histogram creation).

Figure S2: Unprocessed SEM images of Au NWs. Images are given as an example (many more images were used for histogram creation).

Figure S3: Raman scattering from Rhodamine B molecules on oxidised Si wafer with untreated and thermally treated Au nanostructures. The grey spectra indicate background Raman scattering from each SERS substrate without Rhodamine B.
