

## **Supplementary Materials: Establishment and Characterization of New Canine and Feline Osteosarcoma Primary Cell Lines**

Florian R. L. Meyer and Ingrid Walter

## 1. PCR

By means of PCR, the presence of mRNA of tissue unspecific alkaline phosphatase (*ALPL*) and osteonectin (*SPARC*) was detected positively in all tested feline and canine tissue and cell culture samples, except for the cell culture samples of COS\_1220 which lost *ALPL* expression, mirroring the results obtained by immunohistochemistry. However, we failed to amplify osteocalcin (*BGLAP*) mRNA in feline and canine samples. Amplification of the genes in the individual tumour samples and the results of the corresponding melting curve analysis are depicted in Table S1.

**Table S1.** Results of qualitative RT-PCR to determine the mRNA expression of ALPL, SPP1, SPARC and BGLAP.

**Table S1.** Cont.

		<i>ALPL</i>		<i>SPP1</i>		<i>SPARC</i>		<i>BGLAP</i>	
		Amplicon	MC	Amplicon	MC	Amplicon	MC	Amplicon	MC
1189	CC	+	+	+	+	+	+	-	-
1220	Tumour	-	-	+	+	+	+	-	-
1220	CC	+	+	+	+	+	+	-	-
MC	melting curve								
+	positive result								
~	very late amplification signal								
-	negative result								

\* Positive result; ~ very late amplification signal; - negative result.

## 2. DNA Fingerprint Assay

Microsatellite analysis of the established primary cell lines confirmed their origin from the corresponding tumor. In feline samples 16 markers were tested. All markers were identical between tumor tissue and cells in culture. In dogs, 18 markers were tested. COS\_1033 and COS\_1186h cells and tumor were completely identical in their marker setup, although one marker failed to amplify in the latter, both in tumor and in the cell line. COS\_1220 showed one allele changed in a single marker, COS\_1189 had alterations in two alleles. Three markers differed between COS\_1186w and the tumor, although one marker failed to amplify in the tumor sample, but not in the cell line. A complete list of the obtained microsatellite data as first published in [1] is supplied in Table S2 and S3. These list can be helpful in future experiments to exclude cross contaminations.

**Table S2.** Length of microsatellites in dogs used to confirm the cell cultures origins.
