Dear Colleagues,

Abiotic stresses affect mineral nutrient balance, physiological, biochemical, morphological responses, and gene expression of plants growing under salinity stress. There is plenty published on tissue accumulation of NaCl, proline and glycine, physiological aspects, and on the expression of genes that are important to salt tolerance mechanisms. However, we lack information on several aspects including reactive oxygen species, nonenzymatic biochemical markers, root and shoot morphology, hormones, growth regulators, and secondary metabolites that will help us understand plant response to salinity. The interactions between salinity vs. nutrition and drought vs. salinity also need to be better understood to ensure high yield and quality of plant products. Work related to endophytes, chemical primers such as H₂O₂, salicylic acid, and with new crops candidates for cultivation under salinity (including their respective postulated mechanisms of salinity tolerance) is welcome. Message from the Editor-in-Chief

Agriculture (ISSN 2077-0472) is an international, crossdisciplinary and scholarly open access journal on the science and technology of crop and animal production, and management of the natural resource base for agricultural production. *Agriculture* is published in an open access format – research articles, reviews and other contents are released on the internet immediately after acceptance. The scientific community and the public have unlimited and free access to the content as soon as it is published.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed within Scopus, SCIE (Web of Science), PubAg, AGRIS, RePEc, and other databases.

Journal Rank: JCR - Q1 (*Agronomy*) / CiteScore - Q2 (*Plant Science*)
