Message from the Guest Editor

Dear Colleagues,

Interest in wearable electronics, that combine sensors and wireless communication to provide accurate and reliable vital information autonomously, has exploded in recent years to enhance safe and healthy living. This will impact a large range of areas, for example, healthcare, environment, security, defence, the economy and energy. Wearable electronics can be used for health monitoring, activity monitoring, disease detection, robotics, robotic surgery, implantable devices, driverless cars, artificial limb and structural monitoring, virtual reality, and augmented reality. As wearable electronics is of a highly interdisciplinary nature, it requires the convergence of many disciplines, notably from materials development, device design and fabrication, device physics, system integration, software and application verification. This Special Issue will be dedicated to providing academic and industrial communities with news of recent advancements in this exciting field. Original articles are welcome and your contribution would greatly enhance this Special Issue by offering different perspectives on this topic.

Yours sincerely
Prof. Dr. Zhi-Bin Zhang
