Deadline for manuscript
submissions:

closed (31 January 2018)

Message from the Guest Editor

Dear Colleagues,

Functional carbon-based materials are crucial components in many applications, such as electrochemical energy storage (e.g., in battery or supercapacitor electrodes), molecular transformations (e.g., as catalyst supports or metal-free catalysts), adsorption-based processes (e.g., in gas or water purification), as sensors, or in engineering, to mention a few. Nanoporous sp²-based carbon materials with high specific surface area and pore volume are of particular interest because they combine the typical advantages of carbon (i.e., high chemical/thermal stability and electrical conductivity) with a large interface area between carbon and the surrounding phases as well as beneficial effects of nano-confinement.

We are welcoming submissions of manuscripts dealing with all aspects of controlled and sustainable synthesis, new characterization techniques, and applications of nanoporous carbon-based materials to this special issue of C-Journal of Carbon Research. Contributions that draw important structure-performance-relationships are particularly appreciated.

Dr. Martin Oschatz *Guest Editor*
