Message from the Guest Editor

Annually, approximately 13–26 million newborns worldwide need respiratory support immediately after birth, and another 2–3 million newborns need extensive resuscitation including chest compressions and drug administration.

Considering the success and popularity of the Special Issue “Stabilization and Resuscitation of Newborns” previously published in the journal *Children* (https://www.mdpi.com/journal/children/special_issues/Stabiliza) we are now releasing a Second Issue aiming to gather original research papers and review articles focused on Newborn Stabilization and Resuscitation.

In this Special Issue of *Children*, we focus on recent aspects of neonatal stabilization and the resuscitation of preterm and term infants. Both reviews and original research will be considered for publication.
