Message from the Guest Editor

Heritage is what we leave for future generations. Internationally designated heritage areas (i.e., World Heritage, RAMSAR, MAB sites) are the best of the best, the very few locations deserving of conservation in perpetuity. These rare valuable landscapes represent <2% of the world's >130,000 protected areas, and each face biophysical and social risk from climate change and human incursion. Decision making at the local and regional scale balances the knowledge of local conditions, the predicted climatic and socioeconomic influences, and available resources.

Authors are invited to contribute to this Special Issue to advance the management of internationally designated heritage areas. The intended contributions of this Special Issue are: a) an increased consideration of heritage at the landscape scale, b) advancing adaptive, climate-sensitive approaches to management and c) empowering an inclusive approach that effectively engages marginalized and under-represented groups.
