Message from the Guest Editors

Dear Colleagues,

Although the universal hepatitis B virus (HBV) vaccination program has been successfully implemented for almost three decades in many countries, most HBV-related hepatocellular carcinomas (HCCs) occur in unvaccinated middle-aged and elderly adults. The titer of HBV core-related antigen (HBcrAg) reflecting the amount of HBV covalently closed circular DNA (ccc DNA) in the liver is related to HCC occurrence. Sero clearance of HBs antigen (HBsAg) is more crucial than HBV DNA negativity for the prevention of HCC. In addition, the first-line therapies with NAs such as entecavir (ETV), tenofovir disoproxil fumarate (TDF) and tenofovir alafenamide (TAF) remains to be clarified. Therefore, we discuss recent findings of HBV markers related to HCC occurrence and prevention, and unsolved discussions and review the secondary current antiviral therapies for the prevention of HBV-related HCC.

Message from the Editor-in-Chief

You are cordially invited to submit research articles, short communications, comprehensive reviews, case reports or interesting images for consideration and publication in *Diagnostics* (ISSN 2075-4418). *Diagnostics* is published in open access format – research articles, reviews and other contents are released on the Internet immediately after acceptance. The scientific community and the general public have unlimited and free access to the content as soon as it is published. We would be pleased to welcome you as one of our authors.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed within Scopus, SCIE (Web of Science), PubMed, PMC, Embase, Inspec, CAPus / SciFinder, and other databases.

Journal Rank: JCR - Q2 (*Medicine, General & Internal*)
