Message from the Guest Editors

This Special Issue aims to contribute to the 2030 Agenda for Sustainable Development, adopted by all United Nations Member States in 2015. We welcome works in material science, chemistry, geology, nanotechnology and nanoscience, heritage science, and others based on inorganic materials for consolidation and conservation purposes. Works focusing on developing new methodologies and materials for other research purposes in the Heritage field are also considered. Although the issue is focused on inorganic materials, hybrid materials are also a field of interest. Possible topics include, but are not limited to, the following:

- Development of new materials for Cultural and Natural Heritage conservation or consolidation;
- Application of innovative methodologies for the characterisation of inorganic materials in Cultural and Natural Heritage;
- Sustainable materials in/for Cultural and Natural Heritage.
