### **Message from the Guest Editor**

Dear Colleagues,

Selenium, which is an important microelement for human health, plays a critical role in a wide variety of homeostatic processes through selenoproteins, such as the endoplasmic reticulum homeostasis, immune response, regulation of transcription factors and apoptosis, control of the cellular redox state, and development of the central nervous system. Unfortunately, due to the narrow safe dose range of selenium intake, selenium deficiency and selenium excess can both yield adverse effects for human health. Low selenium status has been implicated in an increased risk of mortality, poor immune function, as well as some diseases such as Keshan disease, cretinism, and cognitive decline. Selenium excess leads to some side effects, e.g., hair loss, dermatitis, an elevated disease risk such as type-2 diabetes, and the occurrence of some neurological signs such as amyotrophic lateral sclerosis, hyperreflexia, convulsions, and motor weakness, etc. Including but not limited to selenium, the Special Issue highlights effects of micronutrient intake on human health, welcoming original research articles and reviews regarding this topic.

## Author Benefits

**Open Access:** free for readers, with article processing charges (APC) paid by authors or their institutions.

**High Visibility:** indexed within Scopus, SCIE (Web of Science), PubMed, MEDLINE, PMC, Embase, PubAg, AGRIS, and other databases.

**Journal Rank:** JCR - Q1 (*Nutrition & Dietetics*) / CiteScore - Q1 (*Nutrition and Dietetics*)
