Deadline for manuscript  
submissions:

**5 July 2024**

### Message from the Guest Editor

Dear Colleagues,

Hyperglycemia in pregnancy, including gestational diabetes mellitus (GDM) and known pregestational diabetes, is associated with a range of pregnancy complications that can often be avoided with glucose and weight management. Diet, exercise, and optimization of gestational weight gain are cornerstone of management for all forms of diabetes with or without pharmacotherapy and yet often remain a significant challenge for women during pregnancy. Finally, preventing progression to type 2 diabetes after GDM remains elusive, often due to wider life impacts.

In this Special Issue, we seek submissions involving all aspects of diet therapy relating to the prevention and management of any form of diabetes and/or obesity in pregnancy, including GDM, and including those relating to breastfeeding. This includes programs for the prevention of progression to type 2 diabetes after GDM involving dietary intervention. Reports on relevant clinical trials and nutrition-related health outcomes are encouraged.

Prof. Dr. David Simmons
