Message from the Guest Editor

Dear colleagues,

Since the development of the rigid telescope, endonasal surgery has evolved a lot. Traditionally sinus surgery was performed via an open approach. Since the last decades, many procedures can be done endonasally under endoscopic control. This kind of surgery gives actually excellent results with very low morbidity and quicker rehabilitation.

The aim of this issue is to overview different surgical procedures performed endoscopically through the nose; This concerns either congenital disease, benign or malignant disease, and inflammatory process.

We welcome to this special issue all the contributors that are experts in this kind of surgery.
