Deadline for manuscript
submissions:

closed (28 August 2023)

Message from the Guest Editors

Dear Colleagues,

Spatial epidemiology is an interdisciplinary field that incorporates geospatial components in addressing public health problems. Due to the dynamic nature of infectious diseases, the analysis requires a spatio-temporal approach to monitor, manage, and control the diseases. The integration of spatio-temporal, machine learning, and spatial statistics makes it possible to track infectious disease risk and occurrence associated with environmental factors, urban health, and social sciences. Thus, we are delighted to announce our Special Issue, is accepting submissions in the following areas:

- Spatiotemporal analysis of any kinds of infectious diseases across the world;
- Machine learning approaches to investigate the geographical pattern of infectious diseases;
- The effects of climate change on re-emerging infectious diseases;
- The effects of urban environment on transmission of infectious diseases;
- The effects of immigration on infectious disease transmission;
- Interdisciplinary collaboration: connectivity, cross-linkage of public health, urban health, social science and infectious diseases.
