Message from the Guest Editor

Dear Colleagues,

Global energy markets and the environment in developed and developing countries have become increasingly important areas of economic research, and nowhere is this more apparent than in policy debates. New theories and empirical methods in this area have been developed to assess the values individuals and countries place on multi-facets of energy markets and the environment over the past few decades. The purpose of this Special Issue is to gather a collection of high-quality research papers covering a wide range of topics on the interactions between the economy, energy, and the environment in both developed and developing countries. Areas of particular interest include, but are not limited to, international trade, economic development, the energy–trade nexus, the energy–environment nexus, energy modeling, analyses of renewable and non-renewable resources, oil and gas industry, and energy politics. We also welcome original empirical and theoretical contributions to other aspects of economics, energy, and the environment.
