Wilcoxon signed-rank test is used when normality (Shapiro-Wilk test) assumption is violated. In this case effect size is given by the matched rank bi-serial correlation. Otherwise, Student t-test and Cohen's d for measure effect size are used.

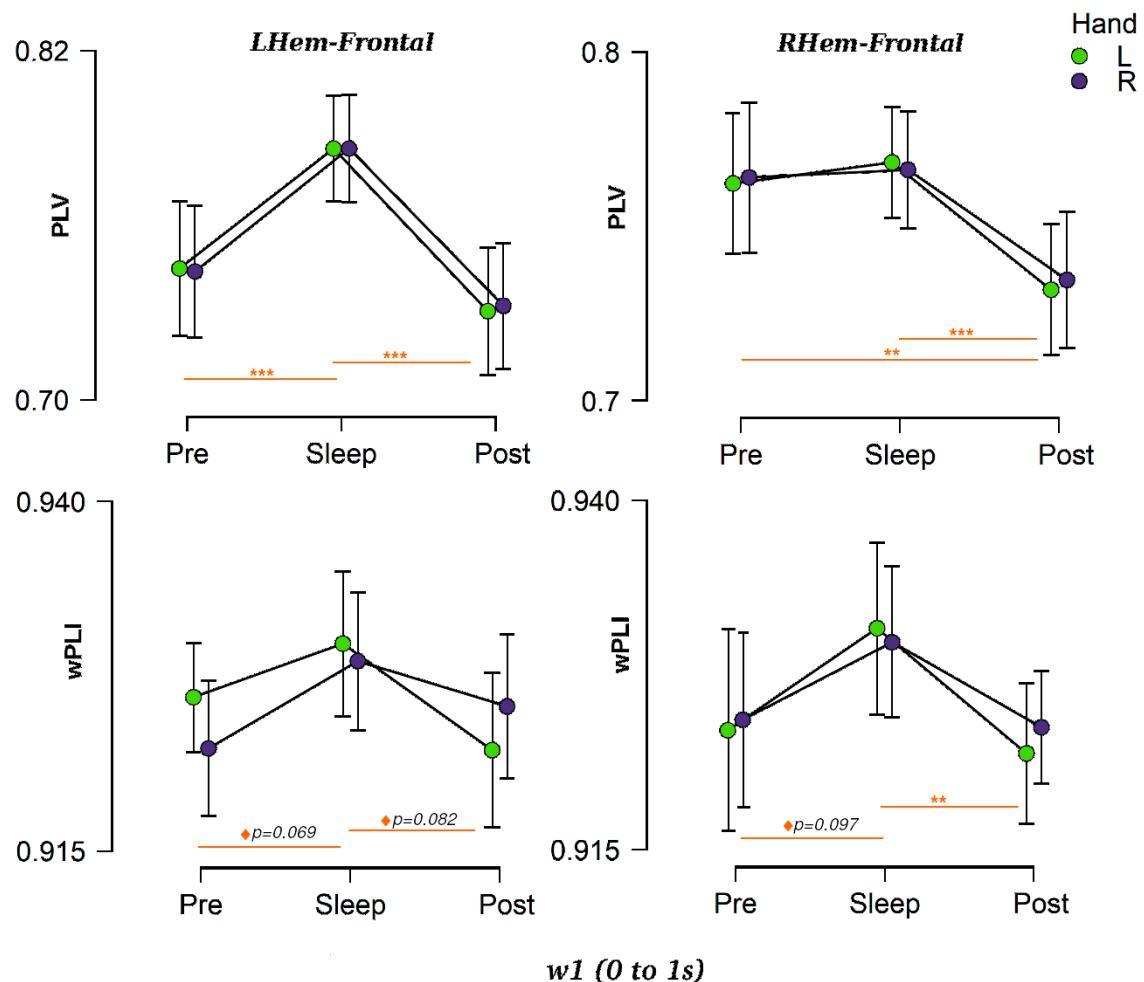

Figure S1. Hemisphere to frontal connectivity for *w1* in each session (Pre, Sleep and Post sleep) for PLV (up) and wPLI (down), left hemisphere-frontal (LHem-F) on the first column and right hemisphere - frontal (RHem-F) in the second column. Purple indicates the connectivity for R hand trials and green dots for L hand trials. Horizontal bars represent 95% confident intervals and those sessions statistically significant are indicated by *** for $p<0.001$, ** $p<0.01$, * for $p<0.05$ and $\diamond p<0.10$.

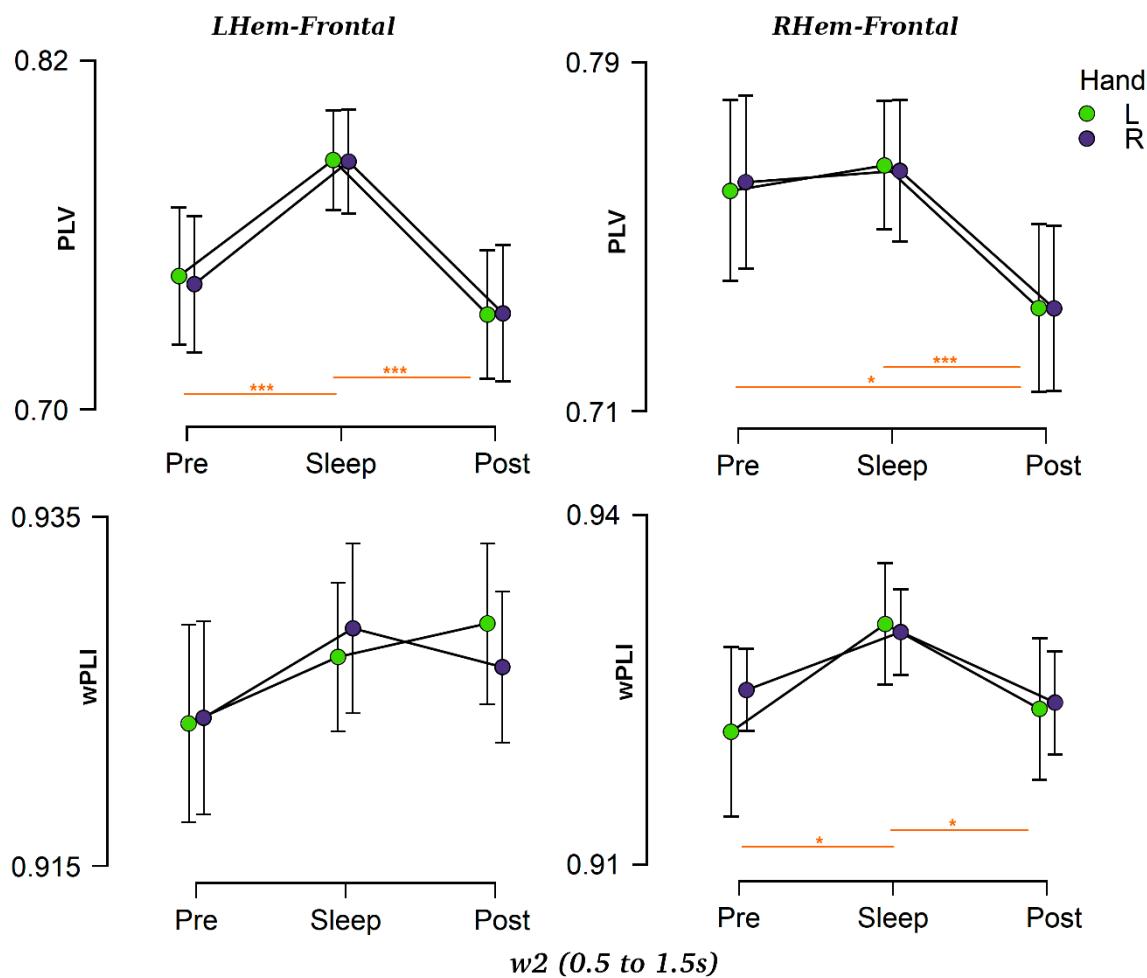

Figure S2. Hemisphere to frontal connectivity for w_2 in each session (Pre, Sleep and Post sleep) for PLV (up) and wPLI (down), left hemisphere -frontal (LHem-F) on the first column and right hemisphere -frontal (RHem-F) in the second column. Purple dots indicate the connectivity for R hand trials and green dots for L hand trials. Horizontal bars represent 95% confident intervals and those sessions statistically significant are indicated by *** for $p < 0.001$, ** $p < 0.01$, * for $p < 0.05$ and o $p < 0.10$.

Table S13. Statistical results from paired t-test comparing R vs. L hands for each window and session for within right hemisphere connectivity. Wilcoxon signed-rank test is used when normality (Shapiro-Wilk test) assumption is violated. In this case, effect size is given by the matched rank bi-serial correlation. Otherwise, paired student t-test and Cohen's d values are stated. All tests were one-tailed.

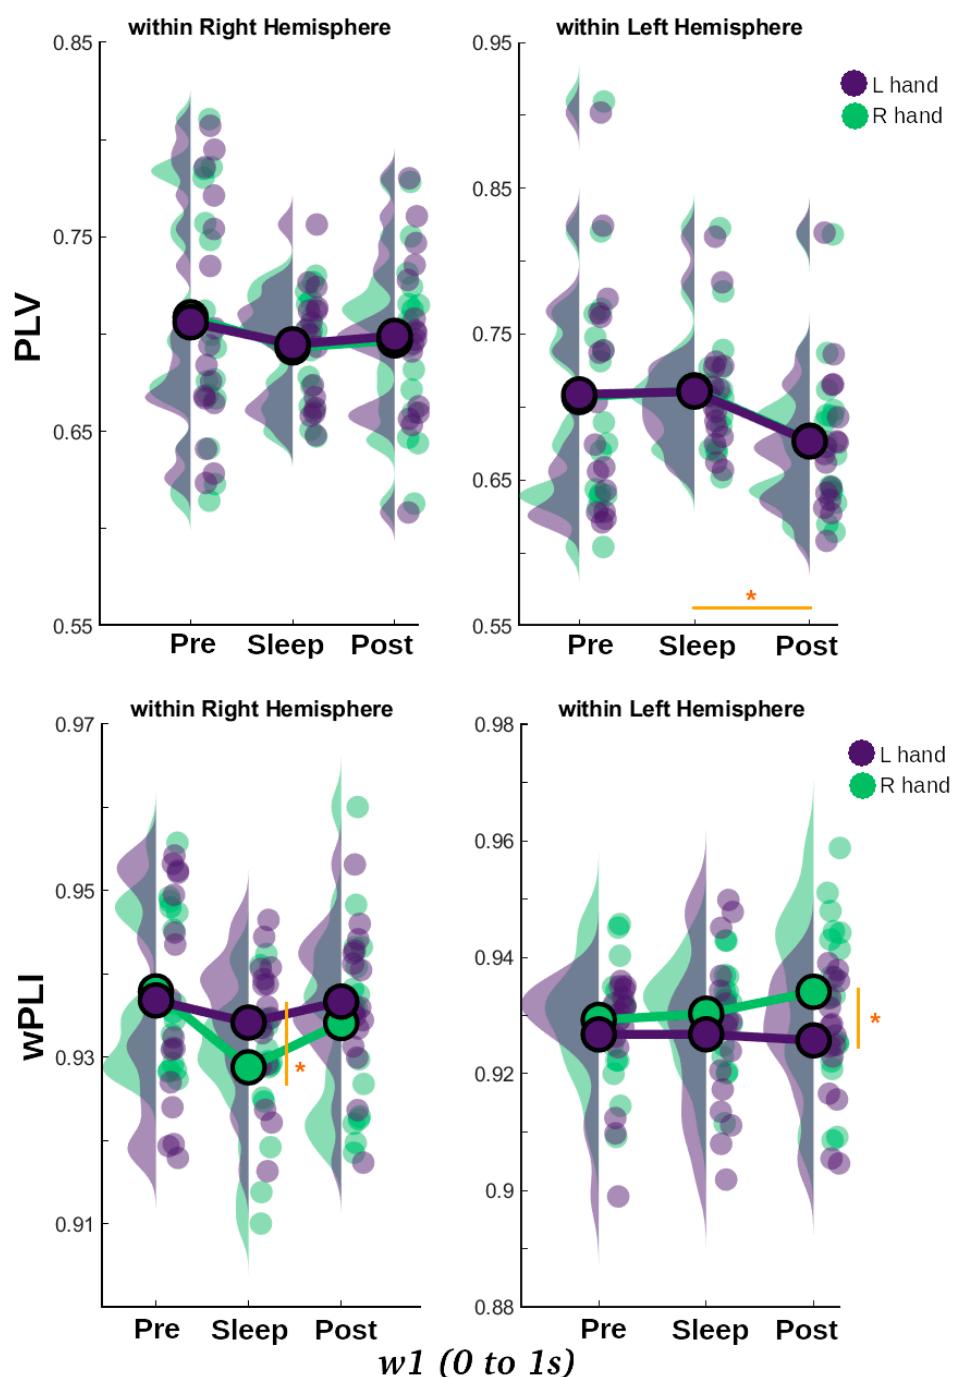

Figure S3. Repeated Measures Anova for PLV (upper row) and wPLI (bottom row) for within right hemisphere (left column) and within left hemisphere (right column) and w1. R hand is shown in green and L hand is represented in purple. Statistically significant results are highlighted in orange (* $p < 0.05$, ** $p < 0.01$, $\circ p < 0.09$).

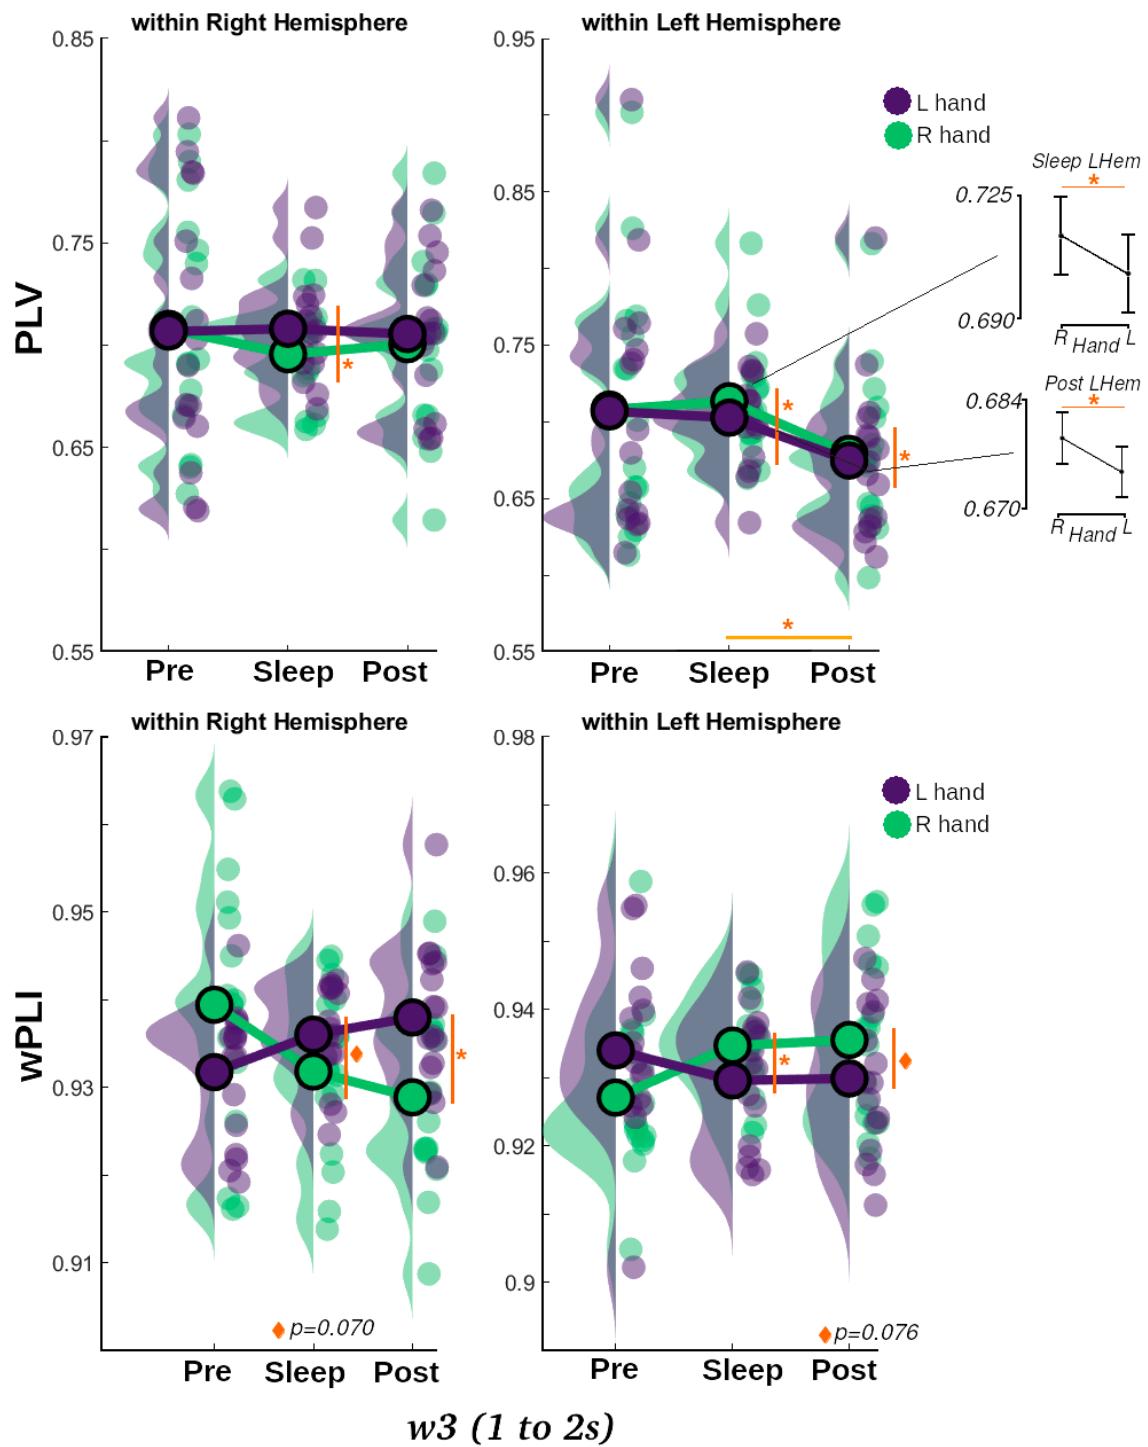

Figure S4. Repeated Measures Anova for PLV (upper row) and wPLI (bottom row) for within right hemisphere (left column) and within left hemisphere (right column) and $w3$. R hand is shown in green and L hand is represented in purple. Statistically significant results are highlighted in orange (* $p < 0.05$, ** $p < 0.01$, ^ $p < 0.09$). Top-left corner graph have two zoomed

Supplementary Materials S4: correlations

For each connectivity we calculated within right hemisphere (left column) and within left hemisphere (right column) values, that are also separated by R and L (the former in a yellowish background) hands. Correlation values are expressed by its value *Rho* and the bootstrapped ($n=50000$) corrected *p*-value. For clarity only correlations under 0.150 are depicted in the tables. Statistically significant correlations are highlighted in bold and darker background.

Supplementary Materials S5: Power analysis

All spectral analysis was performed in fieldtrip for each participant and window of interest without separate between L and R hand conditions. Power spectrum was calculated in the theta band (3-8Hz) using 3 cycles wavelets. The z-normalised values were then averaged within that frequency band and compared between sessions using cluster permutations Fieldtrip function (permutations=10000, alpha=0.05). There were not significant differences among sessions for any of the cases, with the lowest p-value ($p=0.099$) between Pre and Seep for w1 in the occipital channel 02.
