## Part I. Stereochemical Proofs

The peaks in the  $^1\text{H}$  NMR spectra were assigned using  $^1\text{H}/^1\text{H}$  2D COSY,  $^1\text{H}/^{13}\text{C}$  2D HSQC experiments, chemical shifts, and coupling constants. Formation of the 3,4-*syn* stereochemistry for the Mukaiyama aldol reaction along with the stereochemistry of the C2-bromide is supported by relevant nuclear Overhauser effect (nOe) enhancements (2D NOESY) of lactone **S3** resulting from silyl group deprotection of **34a**. Further support for a 3,4-*syn* aldol reaction is obtained from 2D NOESY effects of the final thioanalogues as shown below.

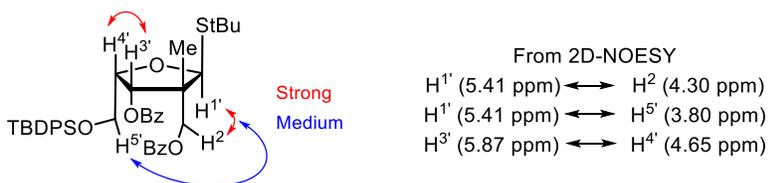

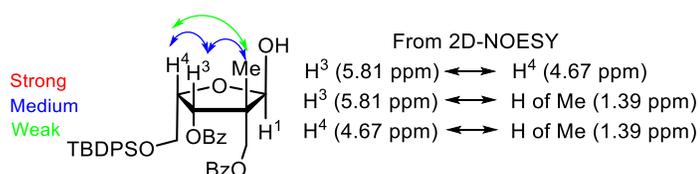

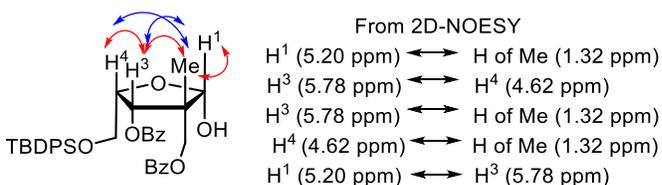

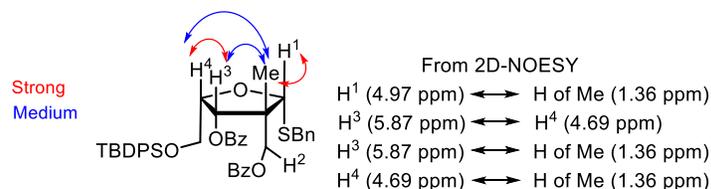

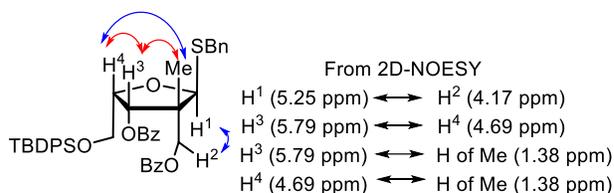

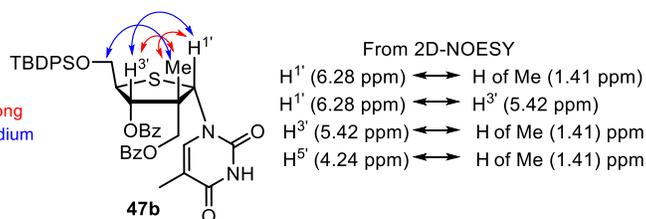

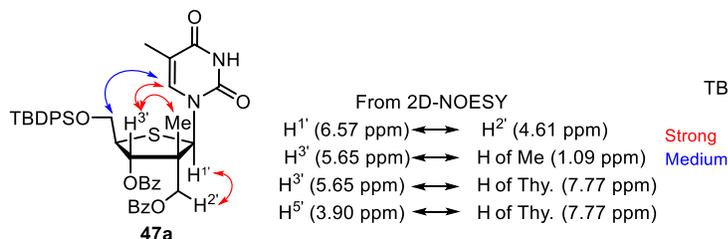

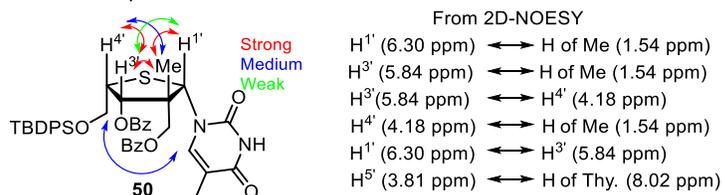

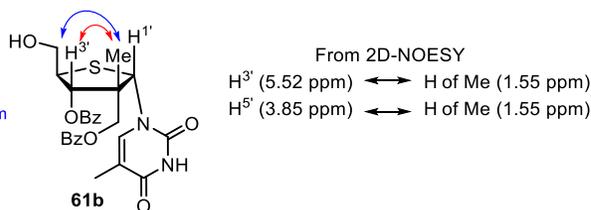

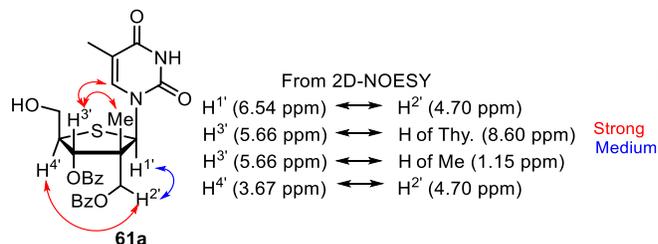

The structure of **34b** as the C2-bromo diastereomer was confirmed from the subsequent vinyl group transfer in which a mixture of dimethylvinylsilanes **35a,b** resulted in formation of only one methylester **36**. The stereochemistry of the C2 all-carbon quaternary center was confirmed in the subsequent cyclized intermediates.

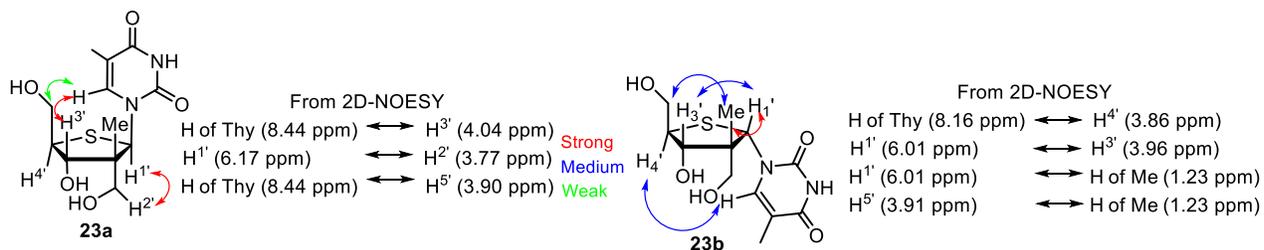

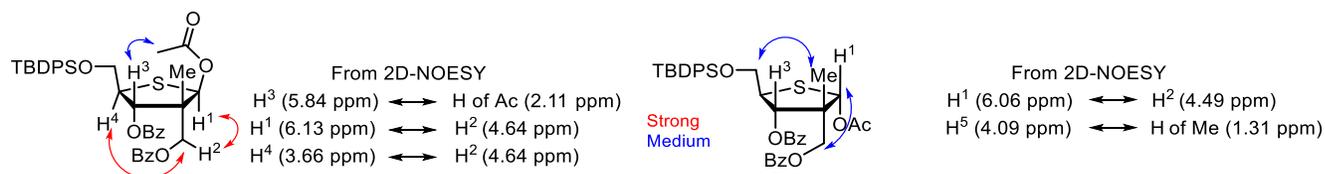

Determining the stereochemistry of the cyclized furanoside and thiofuranoside compounds supports the 3,4-*syn* stereochemistry for the Mukaiyama aldol reaction and the stereochemistry of the C2 all-carbon quaternary center.
