

Table S1. Mean (SD, range) values are presented for body mass index (BMI) and age across cardiorespiratory fitness (CRF) deciles for both men and women. The CRF groups are labelled from 0 for the lowest CRF group to 9 for the highest CRF group and the group specific range of the maximum oxygen uptake ($\text{VO}_{2\text{max}}$) is shown in the brackets.

The superscripted number indicates a statistically significant difference ($p<0.05$) from the specified CRF decile group. An independent-samples Kruskal-Wallis's test with a Bonferroni post-hoc test was used to compare the differences between the CRF groups.

Table S2. Mean (SD) values are presented for the number of hours containing activity and peak intensities across cardiorespiratory fitness (CRF) deciles for both men and women. The CRF deciles are labelled from 0 for the lowest CRF group to 9 for the highest CRF group.
