Quality assessment

Review: Inflammatory Response in Children and Adolescents with Functional Somatic Disorders

NEWCASTLE - OTTAWA QUALITY ASSESSMENT SCALE: CASE CONTROL / COHORT STUDIES

(Note: A study can be awarded a maximum of one star for each numbered item within the Selection and Exposure categories. A maximum of two stars can be given for Comparability).

- **Selection:**

1) Is the case definition adequate?

- a) yes, with independent validation * (the case definition scores positively if accepted diagnostic criteria for FSD were used and an adequate explanation of how this was assessed)
- b) no description

2) Representativeness of the cases

- a) consecutive or obviously representative series of cases * (if the study included both males and females, the proportion of males to females was representative of the population studies of FSD (i.e. F>M) or were not subject to selection bias. Studies were considered to be subject to selection bias when patients recruited from only one setting, e.g. secondary care clinic only)
- b) potential for selection biases or not stated

3) Selection of Controls:

- a) community controls * (if the controls were from the same community/geographical location as the cases)
- b) hospital controls
- c) no description

4) Definition of Controls

- a) no history of disease (endpoint) * (the study had to explicitly state that controls had no history of FSD)
- b) no description of source

- **Comparability:**

5+6) Comparability of cases and controls on the basis of the design or analysis:

- a) study controls for psychiatric comorbidity *
- b) study controls for physical activity and/or obesity *

- **Exposure:**

7) Ascertainment of outcome (inflammatory markers):

- a) Secure record (The measure of inflammatory marker concentration: the paper had to explicitly state the concentration of the measured inflammatory markers to score a star for eligibility point) *

- b) structured interview where blind to case/control status * (laboratory blinded to samples)
- c) interview not blinded to case/control status
- d) written self report or medical record only
- e) no description

8) Same method of ascertainment for cases and controls:

- a) yes *
- b) no

9) Non-Response rate

- a) same rate for both groups *
- b) non respondents described
- c) rate different and no designation
