1. General

All chemicals and solvents were purchased from common commercial sources and were used as received without any further purification. All reactions were monitored by TLC on silica Merck 60 F254 percolated aluminum plates and were developed by spraying with ninhydrin solution. Column chromatography was performed with Merck silica gel (230-400 mesh). The Proton nuclear magnetic resonance (¹H NMR) spectra were recorded on Bruker or Jeol spectrometers at 400 MHz. Chemical shifts are reported in δ units (ppm) with TMS as reference (δ 0.00). All coupling constants (J) are reported in Hertz. Multiplicity is indicated by one or more of the following: b (broad), s (singlet), d (doublet), t (triplet), q (quartet), dd (doublet of doublet), m (multiplet). The Carbon nuclear magnetic resonance (¹³C NMR) spectra were recorded on Bruker or Jeol spectrometers at 100.62 MHz. Chemical shifts are reported in δ units (ppm) and coupling constants (J) in Hertz. The Phosphorus (³¹P NMR) and Fluor (¹⁹F NMR) nuclear magnetic resonance spectra were recorded on a Bruker spectrometer respectively at 161.98 MHz and 316.48 MHz. The Infrared spectra (IR) were recorded on a Perkin Elmer 600 spectrometer. The Mass spectra were recorded on a shimadzu QP 1100 Ex mass spectrometer operating at an ionization potential of 70 eV. Elemental analysis was recorded on a EURO E.A. 3700 apparatus. All melting points were determined on a Büchi B-545 apparatus in open capillary tubes.

Ultrasound assisted reactions were carried out using a FUNGILAB ultrasonic bath with a frequency of 40 kHz and a nominal power of 250 W. The reactions were carried out in an open glass tube (diameter: 25 mm; thickness: 1 mm; volume: 20 mL) at room temperature.

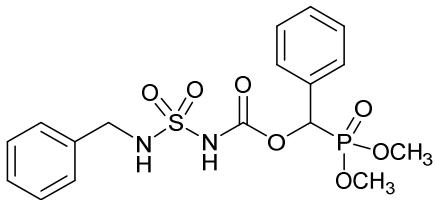

2.a. Typical experimental procedure for the synthesis of α -hydroxyphosphonates

A mixture of aldehyde (1.0 mmol) and trimethylphosphite (1.2 mmol), in a 20 ml open glass tube at room temperature, was subjected to the ultrasonic irradiation for appropriate time. After completion of the reaction, as indicated by TLC, dichloromethane/methanol (9:1), a mixture of diethyl ether/*n*-hexane (6:4) was added to the reaction mixture and the pure product was crystallized at 6 °C overnight. The product was finally filtered and dried.

2.b. Typical experimental procedure for the synthesis of carboxylsulfamidophosphonates

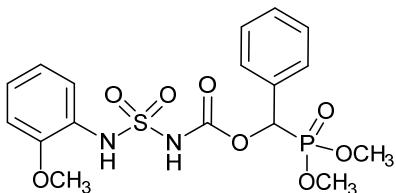

A solution of α -hydroxyphosphonate (1.1 equiv) in anhydrous CH₂Cl₂ (5 ml) was added dropwise to a stirring solution of chlorosulfonyl isocyanate (CSI) (1 equiv) in anhydrous CH₂Cl₂ (5 ml) at 0 °C over a period of 20 min. The resulting solution was transferred to a mixture of primary or secondary amine (1.1 equiv) or amino acid ester or oxazolidinone in CH₂Cl₂ (10 ml) and triethylamine (1.1-1.5 equiv). The solution was stirred at 0 °C for less than 1-2 h. Then the reaction mixture was neutralized adding a solution of HCl 0.1 N to pH 7. The organic layer was extracted, washed with water, then dried over anhydrous sodium sulfate, filtered and concentrated *in vacuo*. A mixture of diethyl ether/*n*-hexane (6:4) was added to the reaction and the pure product crystallized at 6° C overnight. The product was finally filtered and dried in excellent yields.
