o-Aminophenol and Sulfur Sources Supplemented Fermentation

Filter-sterilized ethanol solution of *o*-aminophenol (final concentration 100 mg/L) and sulfur sources, either dimethylsulfide (500 μ L/L) or dimethyldisulfide (500 μ L/L), were added into *Alteromonas* sp. D overnight culture (10 mL of 1/3-ST medium; trypton 1.67 g/L, yeast extract 0.17 g/L in artificial sea water), then further shaken for four days at 30 °C (180 rpm). Centrifuge clarified conditioned media were dissolved in 50 times volume of MeOH, then subjected to the LC-MS analysis equipped with C30 column using scan-mode analysis (m/z 100-500). Only questiomycin A (**1**: m/z = 213.0) was observed in both cases (Figure S23 and S24).

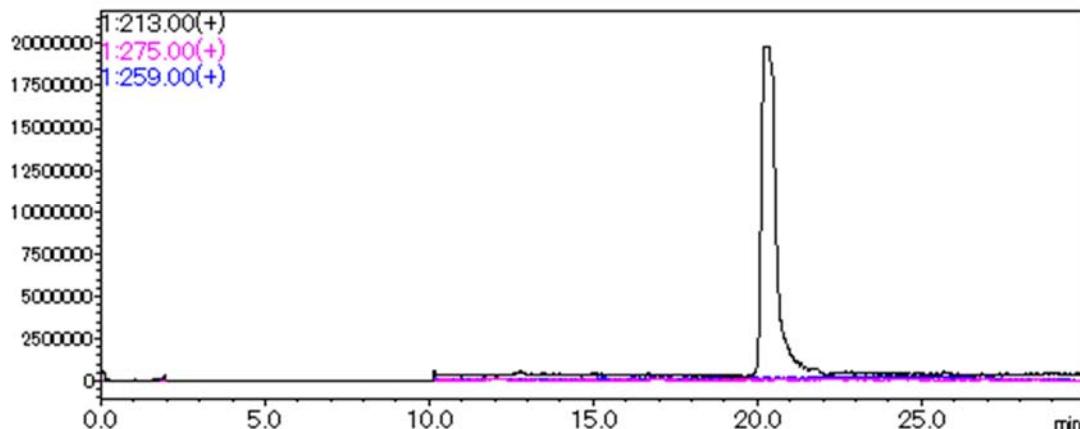

Figure S23. LCMS chromatogram of *Alteromonas* sp. D culture broth supplemented with *o*-aminophenol and dimethylsulfide.

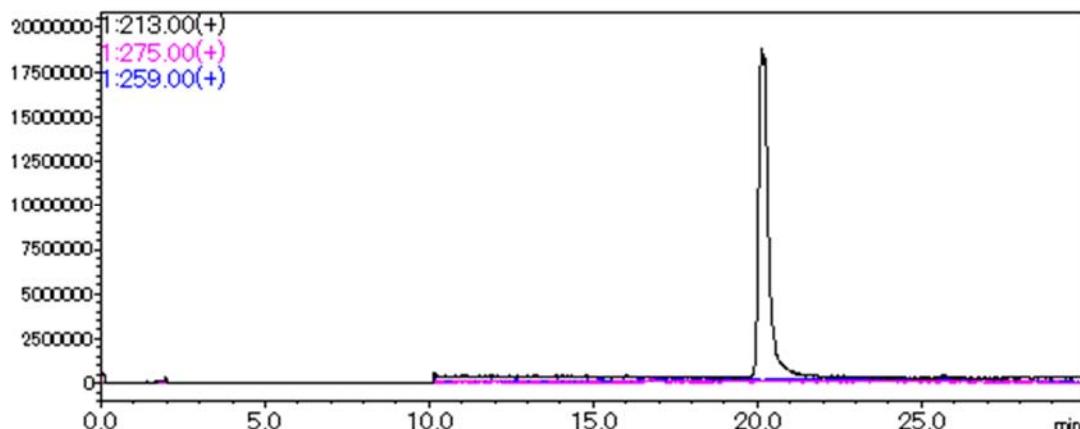

Figure S24. LCMS chromatogram of *Alteromonas* sp. D culture broth supplemented with *o*-aminophenol and dimethyldisulfide.

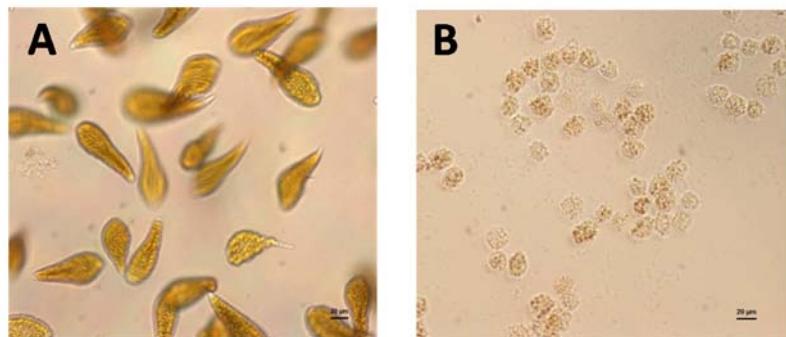

Figure S25. **A:** Cell morphology of live cells of *C. antiqua*. **B:** Dead cells of *C. antiqua* lysed by addition of compound **1**. Scale Bar: 20 μ m.

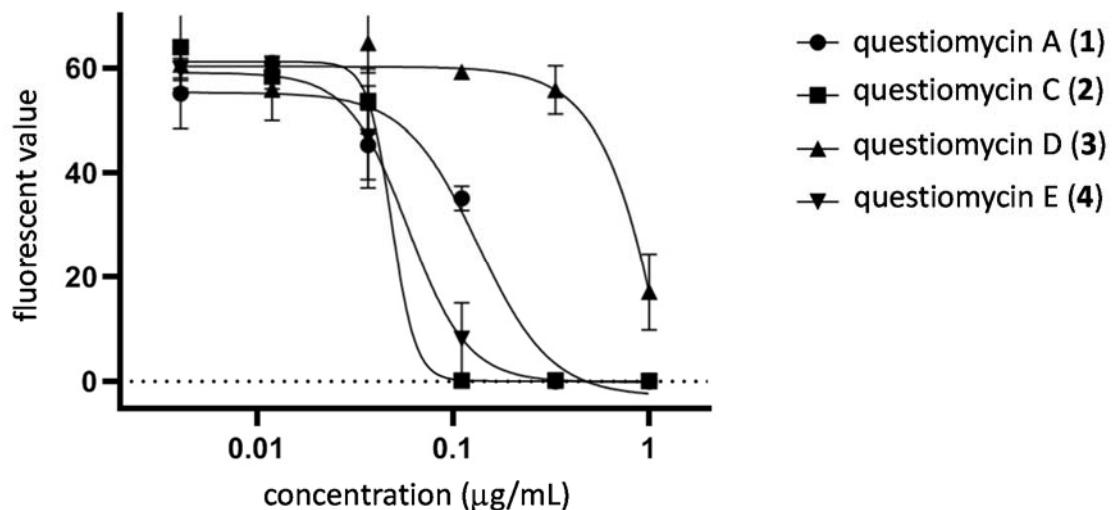

Figure S26. Algicidal activity of questiomycins (**1-4**) against *C. antiqua*. Cell density was estimated from autofluorescence of the live cells. Each data point represent average values \pm standard deviation (n=3).

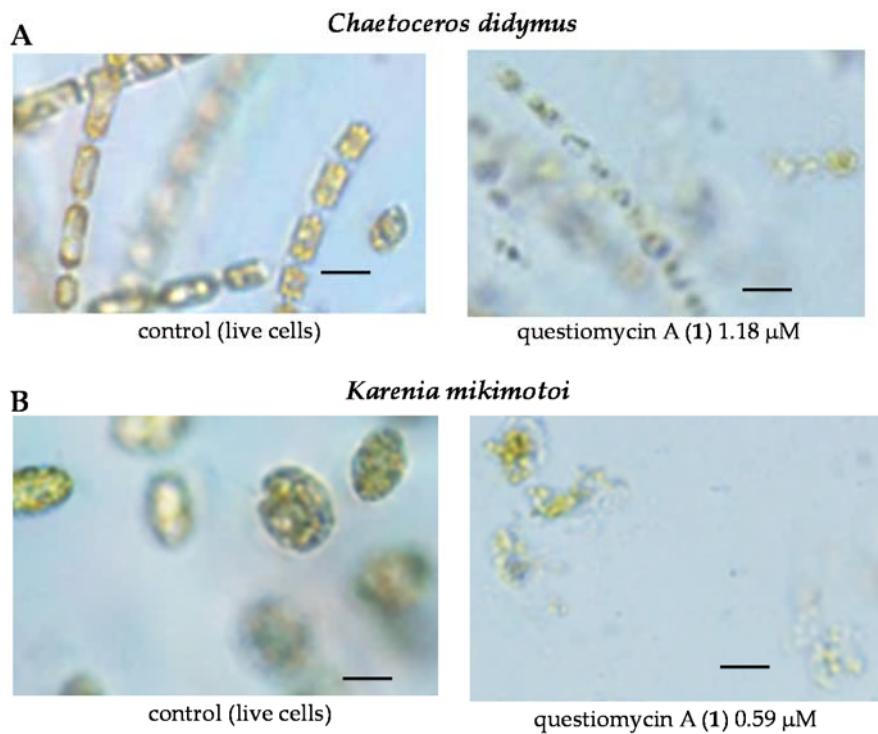

Figure S27. Representative morphological changes of *C. didymus* and *K. mikimotoi* cells caused by addition of questiomycin A (**1**) at the concentration indicated. In *C. didymus* and *K. mikimotoi* cells, nearly all the cells after addition of **1** became fuzzy and cytosol shrinking or leakage were observed. Scale Bar: 20 μm .

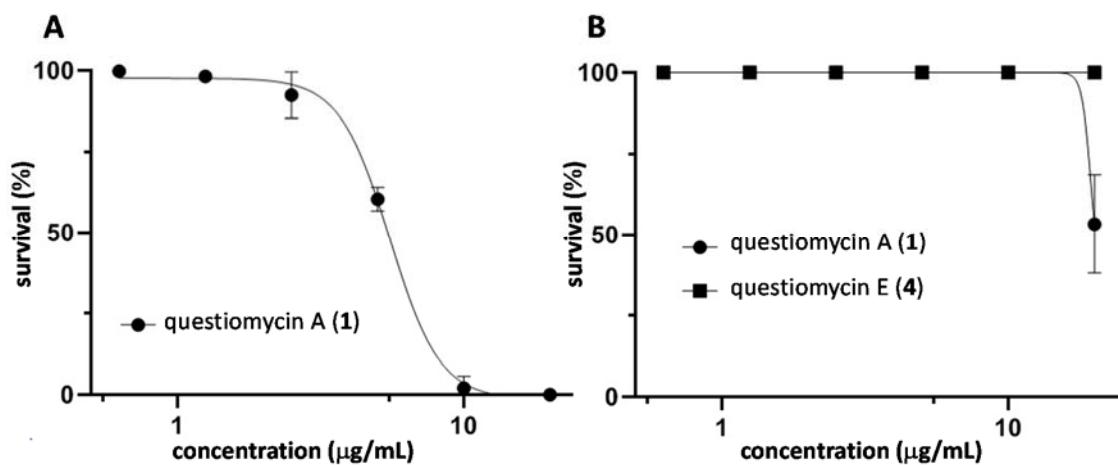

Figure S28. Acute toxicity assay results of the macroalga, *B. fuscopurpurea* (A) and the crustacean, *A. salina* (B), treated with serial dilution of questiomycins. Average values and standard deviation ($n=3$).

Figure S29. Conditioned media of *C. antiqua* and *Alteromonas* sp. D co-cultivation (left), and *C. antiqua* without *Alteromonas* sp. D (right). Debris of the lysed *C. antiqua* cells were deposited on the bottom of the flask to be clear medium (left). On the other hand, live algal cells were swarming in the medium to form water pigmentation (right).

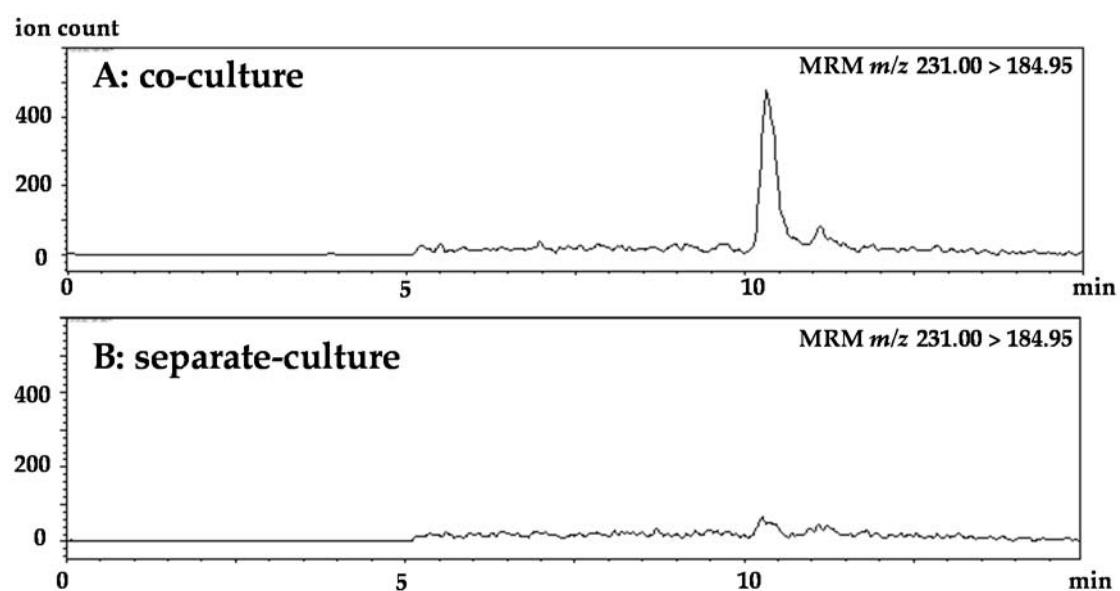

Figure S30. LCMS chromatograms of the extracts of co-culture (A) and separate-culture of *C. antiqua* and *Alteromonas* sp. D. in 6 well plates with and without separation membrane, respectively.

Table S3. Absorption Test of **1**

initial concentration (ng/mL)	3	30	300
polystyrene plate (%)	94	79	80
glass vial (%)	100	100	100

Questiomycin A (**1**) was added into modified SWM-3 medium contained in 6-well polystyrene plates or glass vials adjusted to the final concentration of 3, 30, and 300 ng/mL, then kept for 7 days at room temperature. Concentration of compound **1** in 7 days old solution was measured by LC-MS with MRM method. Recovery rate from polystyrene plate (%) was calculated from the results of glass vials (100% recovery).
