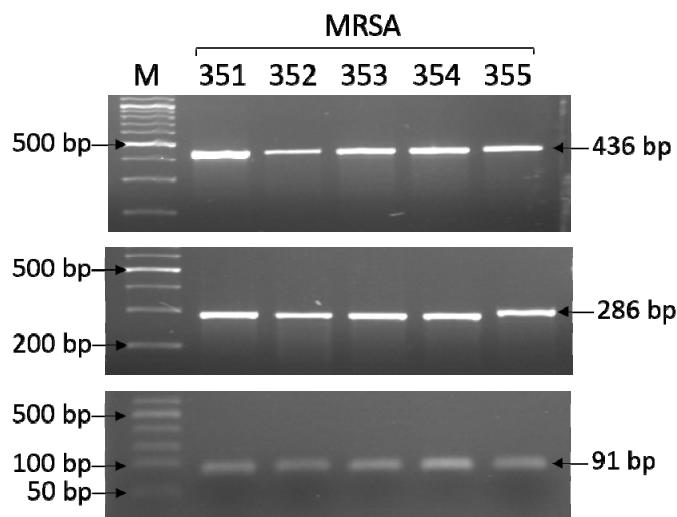

Figure S1. Agarose gel electrophoresis of five MRSA isolates. Identification of resistant strains was performed by detection of *mecA* gene (middle, 286 bp), and identification of efflux pumps were performed by detection of *nora* (upper, 436 bp) and *mepA* (lower, 91 bp) genes in all MRSA strains using PCR assay. Marker (M) and MRSA351-355 strains, respectively.

Supplementary materials and methods

1. Total Phenolic content

Total Phenolic content (TPC) was determined using a modified method of Singleton V. L. and Rossi J.A. in 1965. The aqueous sample solution with concentration of 0-100 $\mu\text{g}/\text{mL}$ was prepared using a 96-well plate model, the reaction mixture that comprised 50 μL of sample solution, 50 μL of 50% v/v Folin-Ciocalteu reagent and 125 μL of 20% w/v sodium carbonate was constituted and mixed gently. Following 40 min incubation at room temperature, the optical absorbance was determined at 700 nm using a microplate reader (SunriseTM micro plate Reader, Männedorf, Switzerland) standard curve development (Gallic acid). TPC was expressed as mg gallic acid equivalence (mg GAE eq/g extract).

2. Total Flavonoid content

Total flavonoid content (TFC) was determined using a modified method of Chang, Zuo, Harrison and Chow in 2002. The sample aqueous solution with concentration of 0-100 $\mu\text{g}/\text{mL}$ was prepared using a 96-well plate model, the reaction mixture that comprised 100 μL of sample solution, 100 μL of 2%(w/v) AlCl₃ solution was constituted and mixed gently. Following 30 min incubation at room temperature, the optical absorbance was determined at wavelength of 437 nm using microplate reader (SunriseTM micro plate Reader, Männedorf, Switzerland) standard curve development (Quercetin). TFC was expressed as quercetin equivalence (mg QE eq/g extract).
