## 1. RESULTS AND DISCUSSIONS

### 1.1. *In silico* studies

**Table S1** presents the Chemical Abstracts Service (CAS) registry numbers, the Simplified Molecular Input Line Entry System (SMILES) notations and the polar surface area (PSA) value for each of the 44 SC obtained through the PubChem online platform. The 44 SC were divided into the following seven groups considering PSA values (ranged from 20.3 to 57.3 Å<sup>2</sup>): 20.3 Å<sup>2</sup> for

(*S*)-MTFP ((*S*)-metamfepramone or *N,N*-dimethylcathinone), MPP, 4-MPBP (4-methyl- $\alpha$ -pyrrolizinobutyrophenone), NPP (naphthylpyrovalerone or naphyrone),  $\alpha$ -PVP ( $\alpha$ -pyrrolidinovalerophenone), 5-PPDI (indanyl- $\alpha$ -pyrrolidinobutiophenone), 4-BrPVP (4-bromo- $\alpha$ -pyrrolidinopentiophenone), 4-FPHP (4-fluoro- $\alpha$ -pyrrolidinohexanophenone), DMP (dimethylpentedrone),  $\alpha$ -PHP ( $\alpha$ -pyrrolidinohexanophenone) and  $\alpha$ -PIHP ( $\alpha$ -pyrrolidinoisohexanophenone); 29.1 Å<sup>2</sup> for 3,4-DMMC, 3-MMC, BPD, 4-MMC, EPH, EPP (ethcathinone), TBCP (bupropion or amfebutamone), 4-MEC (4-methylethcathinone), 4-FMC (4-fluoromethcathinone or flephedrone), 3-FMC (3-fluoromethcathinone or 3-flephedrone), 4-MPD (4-methylpentedrone),  $\alpha$ -BHP ( $\alpha$ -butylaminohexanophenone), 4-BMC (4-bromomethcathinone or brephedrone), MPH (hexedrone), 2,4-DMEC (2,4-dimethylethcathinone), 2,4-DMMC (2,4-dimethylmethcathinone or 2-methylmephedrone), BMAPN (2-(methylamino)-1-(naphthalen-2-yl)propan-1-one),  $\alpha$ -PPP ( $\alpha$ -propyloaminopentiophenone or *N*-propylpentedrone) and PTD; 29.5 Å<sup>2</sup> for 4-MeO- $\alpha$ -PHPP (4-methoxy- $\alpha$ -pyrrolidinoheptanophenone), 4-MeO- $\alpha$ -POP (4-methoxy- $\alpha$ -pyrrolidinoctanophenone) and 4-MeO- $\alpha$ -PVP (4-methoxy- $\alpha$ -pyrrolidinovalerophenone); 38.8 Å<sup>2</sup> for MDPV, MDPBP (3,4-methylenedioxy- $\alpha$ -pyrrolizinobutyrophenone) and 3,4-DMPVP (3,4-dimethoxy- $\alpha$ -pyrrolidinopentiophenone); 43.1 Å<sup>2</sup> for CATH; 47.6 Å<sup>2</sup> for BTL, bk-MDEA (ethylone), bk-EBDB (eutylone), bk-MAP, bk-EBDP (*N*-ethylpentylone) and bk-MBDP (pentylone); and 57.3 Å<sup>2</sup> for MTP (thiothinone).

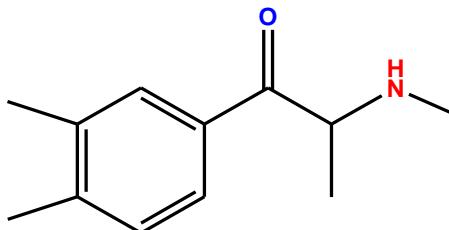

**Table S1:** Acronym, International Union of Pure and Applied Chemistry (IUPAC) name, Chemical Abstracts Service (CAS) number, chemical structure, Simplified Molecular Input Line Entry System (SMILES) notation and polar surface area (PSA) value of 44 SC for *in silico* studies.

## 1.2. In vivo assays

### 1.2.1. Sub-chronic assays in *Tetrahymena thermophila*

Sub-chronic ecotoxicity assays were performed on *T. thermophila* for 28 hours (h), and a reference test with K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> at five concentrations ranging between 5.60 and 56.00 mg L<sup>-1</sup> was conducted. The respective results are described in **Table S3**.

**Table S3:** Percentage of growth inhibition vs log concentration of *Tetrahymena thermophila* after 28 h of exposure to K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> at five concentrations tested.

Reference test/Log concentration	Growth inhibition average (%)				
	0.748	1.000	1.255	1.505	1.748
K <sub>2</sub> Cr <sub>2</sub> O <sub>7</sub>	-3	5	50	86	85

## 2. MATERIALS AND METHODS

### 2.1. In vivo assays

#### 2.1.1. Sub-chronic assays with *T. thermophila*

A ciliate inoculum was prepared from a stock culture by adjusting optical density (OD) at wavelength ( $\lambda$ ) of 440 nm to 0.040 with standard freshwater (SFW) medium. To perform the assays, disposable 1 cm spectrophotometric cells were used to measure the OD. Each test cell contained 40  $\mu$ L of *T. thermophila* ciliate inoculum and food suspension. Control and five tested synthetic cathinones (SC) were incubated in an Infors HT Ecotron incubator (Fisher Scientific, Portugal) at 30 °C in darkness, for 24 and 28 h. Assays were performed in triplicate and OD measurements at 0, 24 and 28 h were performance using an UV/Vis spectrophotometer (ATI Unicam, Leeds, England) at 440 nm. The OD in the controls after 24 or 28 h of incubation must show a decrease of the T0 value by at least 60 % as the uninhibited growth of the ciliates will consume the food substrate. The percentage of growth inhibition can be calculated from the difference in OD between the control cells and the test cells after 24 or 28 h using the following equation:

$$\% \text{ Growth Inhibition}_{(C1-C5)} = \left( 1 - \frac{\Delta OD_{(C1-C5)}}{\Delta OD_{(C0)}} \right) \times 100 \quad (1)$$

where  $\Delta OD_{(C1-C5)}$  is the difference between the absorbance after the incubation (T24h or T28h) and prior to the test (T0h) and  $\Delta OD_{(C0)}$  is the absorbance in the control tests.

#### 2.1.2. Sublethal assay with *Daphnia magna*

##### 2.1.2.1. Culture maintenance of microalgae *Raphidocelis subcapitata*

The microalgae *R. subcapitata* culture medium is prepared using the following macronutrients stock solutions: 2.55 g of NaNO<sub>3</sub>; 1.22 g of MgCl<sub>2</sub>.6H<sub>2</sub>O; 0.44 g of CaCl<sub>2</sub>.2H<sub>2</sub>O; 1.47 g of MgSO<sub>4</sub>.7H<sub>2</sub>O; 0.10 g of K<sub>2</sub>HPO<sub>4</sub>; and 1.50 g of NaHCO<sub>3</sub> prepared in 100 mL of distilled water and stored in an amber glass bottles at 4 °C. A micronutrients stock solution is prepared containing the following substances: 46.38 mg of H<sub>3</sub>BO<sub>3</sub>, 103.85 mg of MnCl<sub>2</sub>.4H<sub>2</sub>O, 0.82 mg of ZnCl<sub>2</sub>, 39.94 mg of FeCl<sub>3</sub>.6H<sub>2</sub>O, 0.36 mg of CoCl<sub>2</sub>.6H<sub>2</sub>O, 1.82 mg of Na<sub>2</sub>MoO<sub>4</sub>.2H<sub>2</sub>O and 75.00 mg of Na<sub>2</sub>EDTA.2H<sub>2</sub>O prepared in 250 mL of distilled water and stored in an amber glass bottle at 4 °C. About 1 mL of each macronutrient stock solution and 1 mL of micronutrients stock solution is added each 1 L of distilled water and pH adjusted to 7.5 ± 0.1.

The culture is maintained for 7 days in the bioterium at a constant temperature (20 ± 2 °C) with illumination at 6000 lux and a photoperiod of 16:8 h light: dark.

##### 2.1.2.2. Biochemical determinations

The Bradford assay is a colorimetric technique used for protein quantification. A calibration curve with bovine serum albumin (BSA) was performed at a concentration range of 0.0015 to 0.0250 mg mL<sup>-1</sup>. Each sample (2  $\mu$ L diluted in 98  $\mu$ L of phosphate buffer solution (PBS)) were

incubate for 5 min at room temperature (RT) with 100 µL of Bradford reagent. The absorbance was read at  $\lambda$  of 595 nm in a microplate reader and results express as mg mL<sup>-1</sup> of BSA [1, 2].

Catalase (CAT) activity was determined with a spectrophotometric method at  $\lambda$  of 415 nm and 25 °C. Briefly, the standards of CAT and samples (50 µL) were incubated with 100 µL of 60 µM H<sub>2</sub>O<sub>2</sub>/60 mM sodium phosphate buffer (SPB) at 37 °C for 1 min. The enzymatic reaction was stopped by the addition of 250 µL of 32 mM ammonium molybdate tetrahydrate (AMT), incubate at RT for 5 min. Blanks were prepared with PBS, 60 µM H<sub>2</sub>O<sub>2</sub>/60 mM SPB and 32 mM AMT. CAT activity is determined by a calibration curve of CAT (concentration range of 0.156 to 7.000 U mL<sup>-1</sup>), and results express as U of CAT per mg of protein [3-5].

For Reactive oxygen species (ROS) assay, the 2',7'-dichlorofluorescin diacetate (H<sub>2</sub>DCFDA), a fluorescent probe was used. For that, 10 µL of each sample, 110 µL of PBS and 8.3 µL of 21 mM H<sub>2</sub>DCFDA are incubate at 37 °C for 30 min. Fluorescence was read at 25 °C with an excitation  $\lambda$  of 485 nm and an emission  $\lambda$  of 528 nm in a microplate reader. Results was express as µmol of DCF per mg of protein, through a DCF calibration curve (concentration range of 0.078125 to 20.00 µM) [6, 7].

Lipid peroxidation was measured through the thiobarbituric acid reactive substances (TBARS) assays. Samples (10 µL) with ultrapure water (UPW; 70 µL), 50 mM PBS (50 µL), 1 mM BHT (2,6-di-tert-butyl-4-methylphenol; 10 µL), 1.3 % TBA/0.3 % NaOH (75 µL) and 50 % trichloroacetic acid (50 µL) were incubated for 2 h at 60 °C. After cool for 15 min on ice, the final reagent was added, the 20 % sodium dodecyl sulphate (10 µL). Absorbance was measure at  $\lambda$  of 530 nm in a microplate reader and the results express as µmol of MDA per mg of protein, considering the calibration curve of MDA (concentration range of 2.5 to 100.0 µM) [8-10].

A colorimetric assay for detection of acetylcholinesterase (AChE) activity was based on an improved *Ellman* method. For the assay 20 µL of samples was used with 120 µL of 0.5 mM DTNB (diluted in 0.05 M tris buffer) and 60 µL of 20 mM iodinated acetylthiocholine and incubated for 5 min at RT. Absorbance was read in a microplate reader at  $\lambda$  of 412 nm at 25 °C for 3 min [11, 12]. The AChE concentration was calculated following the next formula of extinction coefficient ( $\epsilon$ ):

$$\epsilon = \frac{A}{c \times l} \quad (2)$$

where TNB  $\epsilon_{412 \text{ nm}}$  of  $14.1 \times 10^3 \text{ M cm}^{-1}$  ( $14.1 \text{ mL mmol}^{-1} \text{ cm}^{-1}$ ), optical path ( $l$ ) of 0.8 cm, absorbance of sample (A) and molar concentration (c). AChE concentration (mol mL<sup>-1</sup>) results were expressed as mmol of TNB per mg of protein.
