## 1. Real-time monitoring of carbon monoxide pressure

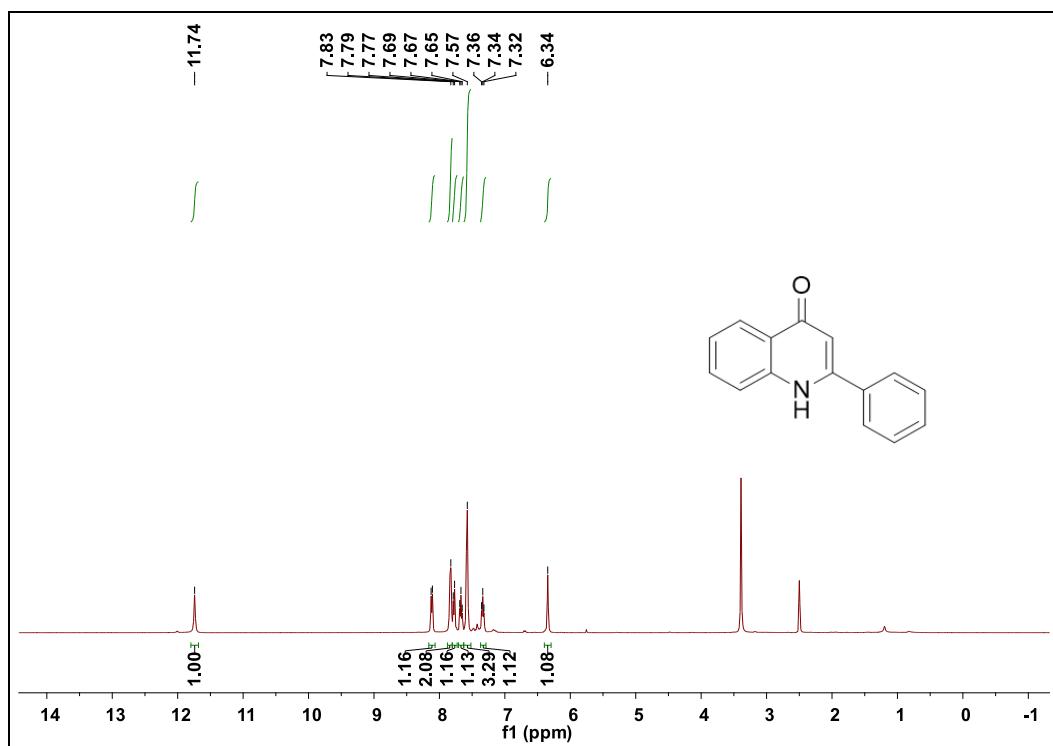

The Sonogashira carbonylative annulation of 2-iodoaniline, phenylacetylene, and Fe(CO)<sub>5</sub> was used as the model reaction. Under the identified reaction conditions (**Table 1**, entry 12), we observed pressure changes in the reaction vial (**Figure 1**). All reagents were added to a 31 mL vial at room temperature, then a stirrer was added and the vial was sealed with a rubber stopper. The differential pressure gauge was connected and the needle hole was sealed with hot melt adhesive. After preparation, the reaction vial was immediately placed on a stirring table heated to 60°C and the speed was adjusted to 400 rpm. Pressure changes were recorded continuously for 4 hours, and the results are shown in **Figure 1**.
