Data are results of a two-way factorial ANOVA: (1) F-criteria with *p* values in parentheses for the main effect of the group factor, (2) mean ± SEM values for the experimental groups with *p* values in parentheses for Bonferroni's correction of pairwise comparison of the groups at time points 10 days and 30 days after surgery, S – comparison with the sham-operated group, I – comparison with positive controls. Significant tests are highlighted in bold.
