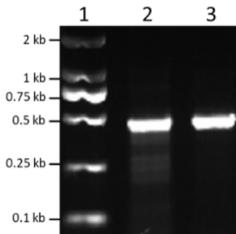

Figure S1. The results of the coding sequence (CDS) amplification of *BocMBF1c*. **1.** The channel of Marker, M2000, was used as a DNA ladder, yielded bands of 2 kb, 1 kb, 0.75 kb, 0.5 kb, 0.25 kb, and 0.1 kb from up to the bottom in the lane; **2.** and **3.** amplicons of *BocMBF1c* CDS from gDNA and cDNA, respectively.

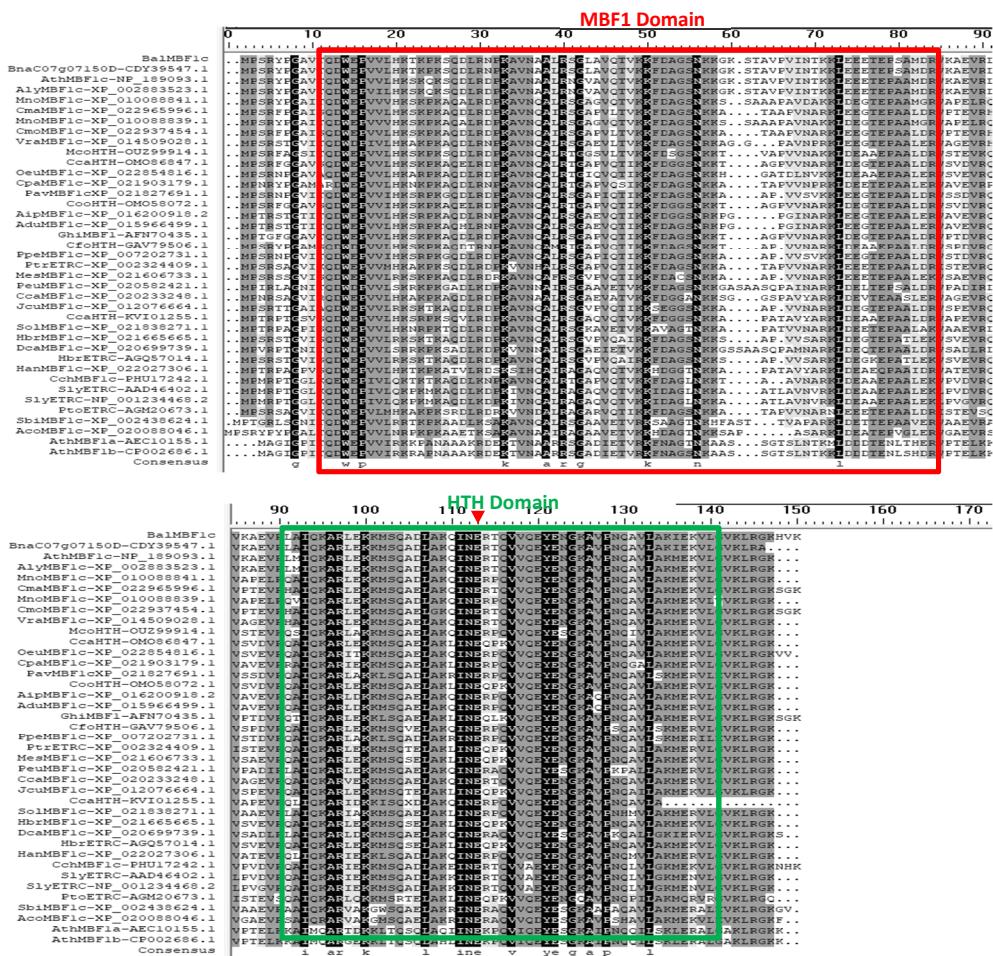

Figure S2. Multiple alignments of the predicted amino acid sequence around the conserved domain of MBF1 and HTH from *BocMBF1c* with various other similar proteins. The 38 proteins used in this

program are listed in Table S1. Gaps are indicated by a solid circle; conserved amino acids are shaded black and similar amino acids are shaded gray. Red underlines indicate the *MBF1* gene family domain; green underlines indicate the HTH domain.

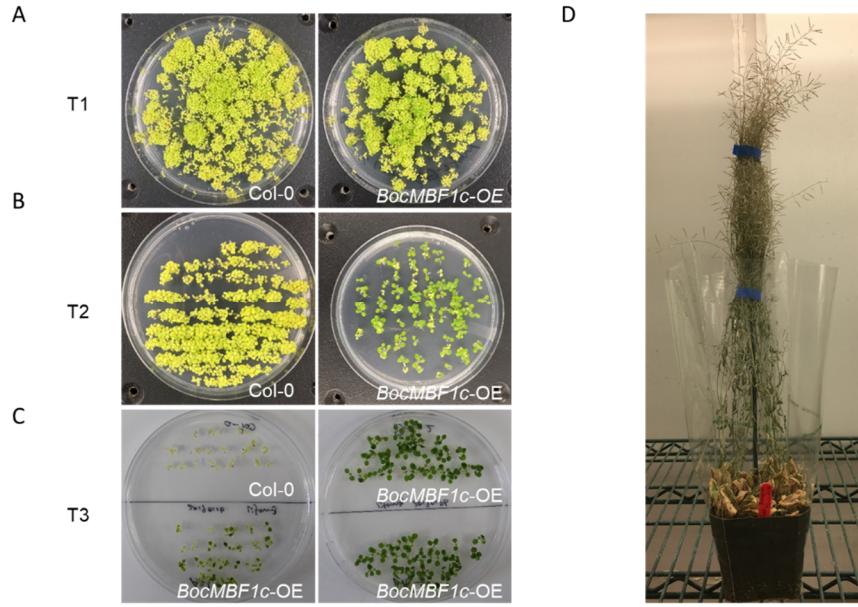

Figure S3. The selection of homozygous transgenic lines of *BocMBF1c*. (A) The T₁ seeds that survived the Kanamycin selection were collected as positive transgenic lines; (B) the T₂ generation showing segregation of resistant-to-sensitive under Kanamycin selection; (C) the T₃ generation showing 100% resistance to Kanamycin were chosen as homozygous transgenic lines for further study; (D) the T₄ seeds that will be mix harvested from T₃ generation.

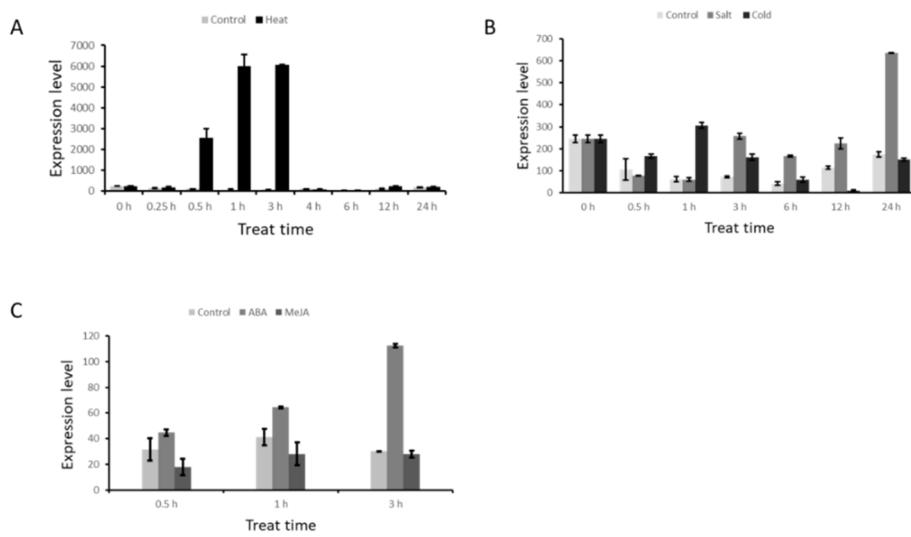

Figure S4. Response of *AtMBF1c* to various abiotic treatments. (A) Temporal expression of *AtMBF1c* under heat treatment (30 °C). (B) Temporal expression of *AtMBF1c* under cold condition (4 °C) and salinity environment (200 mM NaCl). (C) Temporal expression of *AtMBF1c* after applied ABA (10 μM), MeJA (10 μM), respectively. All data were obtained through an online database (http://bar.utoronto.ca/efp_arabidopsis/cgi-bin/efpWeb.cgi) [18].
