Microbiology - *In vitro* Antimicrobial Assay Results

(a)

(b)

Figure S1. The antimicrobial activity data of the: (a) compound **29** and (b) nitrofurantoin, against tested reference Gram-positive bacterial strains. (no bioactivity – MIC >1000 µg/mL; mild bioactivity – MIC = 501–1000 µg/mL; moderate bioactivity – MIC = 126–500 µg/mL; good bioactivity – MIC = 26–125 µg/mL; strong bioactivity – MIC = 10–25 µg/mL; very strong bioactivity – MIC <10 µg/mL).

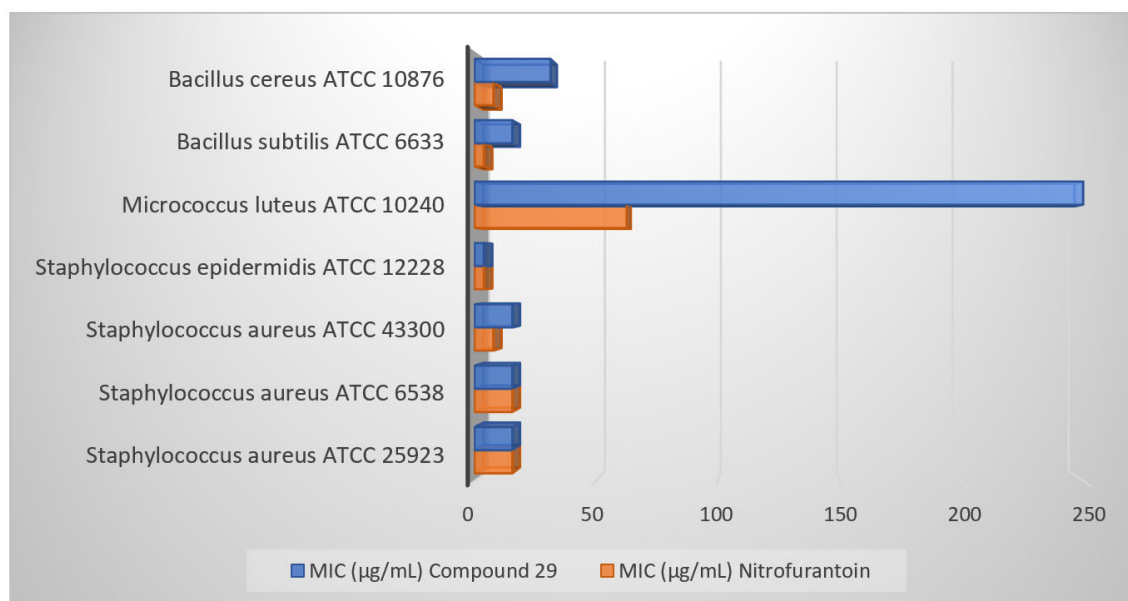

Figure S2. The antimicrobial activity assay results (MIC, µg/mL) for the compound **29** in comparison with nitrofurantoin against the reference Gram-positive bacterial strains.
