This table presents the distribution of the concentrations among sixty women undergoing IVF with a PGT-A and SET/FET [the minimum, maximum and quartile values (25%, 50%, and 75%) are indicated]. Urinary concentrations were corrected by creatine (CR) levels to account for urine dilution. Follicular fluid, urine and plasma non-essential trace metals concentrations are expressed as ng/mL. Creatinine corrected values are expressed as  $\mu\text{g/g}$  of creatinine ( $\mu\text{g/g CR}$ ).
