Table S22. Sensitivity analysis of generation length on TENT.

S1. N_e estimates from Indels on TENT, with comparisons to MP-EST* tree.

The highest estimated N_e values ranged from 3,258, 842 to 26,127,434 in the TENT, with higher estimates in more size inclusive partitions (Table S4). Lowest estimated N_e values ranged from 110,471 to 329,562, with higher estimates in more size inclusive partitions. N_e estimates were generally similar in both absolute magnitude and relative rank order in the MP-EST* tree and TENT for those nodes branches that were present in both trees (Tables S5-S9). Notable exceptions, however, include the hoatzin+Cursorimorphae+waterbirds+Telluraves branch which differed by an order of magnitude between the MP-EST* tree and TENT within each indel partition and the Coraciimorphae branch which differed two-fold in most indel size partitions. All of the five highest estimated N_e 's were the same branches in both trees, with the exception of hoatzin+Cursorimorphae+waterbirds+Telluraves and Coraciimorphae. The highest N_e estimates common to both trees and across all indel size partitions was the Columbimorphae branch. Others that tended to rank high, however inconsistently across partitions, included bee-eater+woodpecker, Cursorimorphae, and turaco+bustard. Five branches in each of the MP-EST* tree and TENT are not present in the other; thus, cannot be compared. The lack of congruence in these trees involve rearrangement of very short internal branches and nearly equal levels of gene tree concordance/discordance with respect to these particular branches.

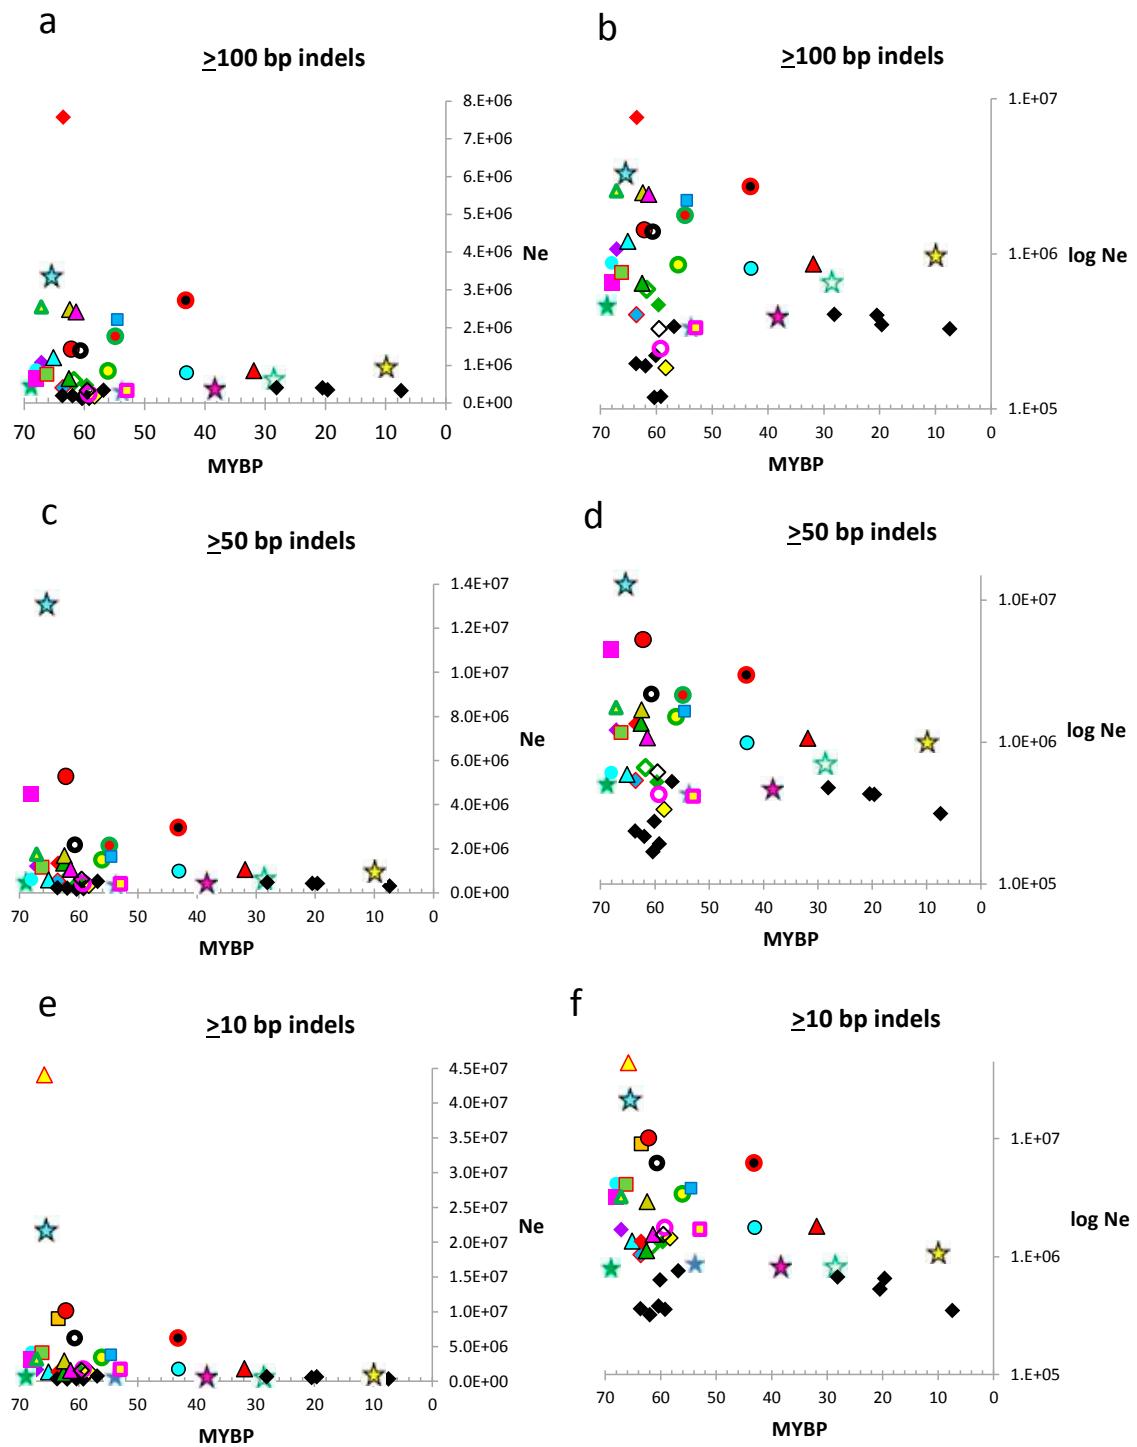

S2. N_e estimates from Gene Trees.

All gene tree analyses showed a distinct spike in estimated N_e near the $K-Pg$ boundary when plotted against MP-EST* and TENT timetrees (Figures S3-S8; Tables S11-S12). Gene tree N_e estimates tended to be higher than indel N_e estimates whether or not they included indels. Indel gene trees yielded higher upper quartile and median N_e estimates than nucleotide gene trees (Table S10) but the difference was not consistent on any given branch, and nucleotide gene trees yielded the highest estimates overall. The highest gene tree N_e estimates were consistently higher using 1938 loci than with 2515 loci (Tables S11, S12). The highest gene tree N_e estimates were slightly higher when made on the MP-EST* tree than on the TENT when the highest scores were branches shared by both trees (Tables S13-S20). Gene trees tended to favor turaco+bustard as the highest estimated N_e when CBL was positive, or Columbimorphae when it was not. Cursorimorphae and bee-eater+woodpecker were also among the highest N_e estimates. Other branches such as hoatzin+Cursorimorphae+waterbirds+Telluraves, Otidimorphae+Columbimorphae, and

waterbird+Telluraves, were high on one tree or the other but not comparable due either to zero CBL or non-recovered on both trees.

S3. Generation Length Sensitivity Analysis

We report the ancestral generation length that would be required to reduce our N_e estimates for each branch into the median and upper quartile of each size partition using the MP-EST* tree and the TENT (Tables S21, S22). The MP-EST* results are reported in the main text so only the TENT results are summarized here. Longer generation lengths were typically implied using short indels, which are characterized by shorter CBL. Among the clades with the highest estimated N_e , Columbimorphae required a generation length of 26.6-69.8 years (yrs) for the upper quartile and 46.4-143.3 yrs. Values for hoatzin+Cursorimorphae+waterbirds+Telluraves ranged from 7.2-52.3 yrs for the upper quartile and 13.0-107.4 yrs for the median. Although turaco+bustard had among the highest estimated N_e in many size partitions, its implied generation lengths were lower: 20.6-24.8 yrs for the upper quartile and 33.6-45.0 yrs for the median.

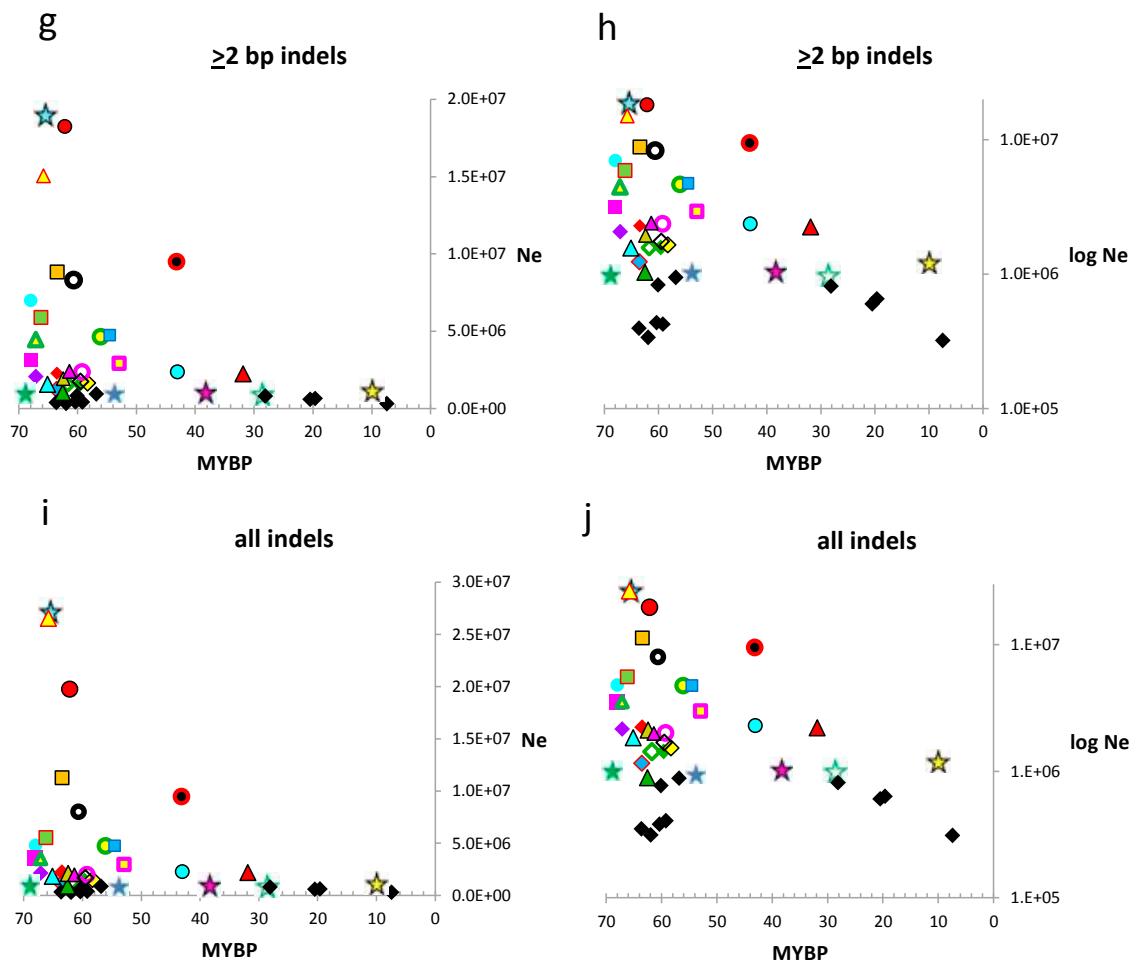

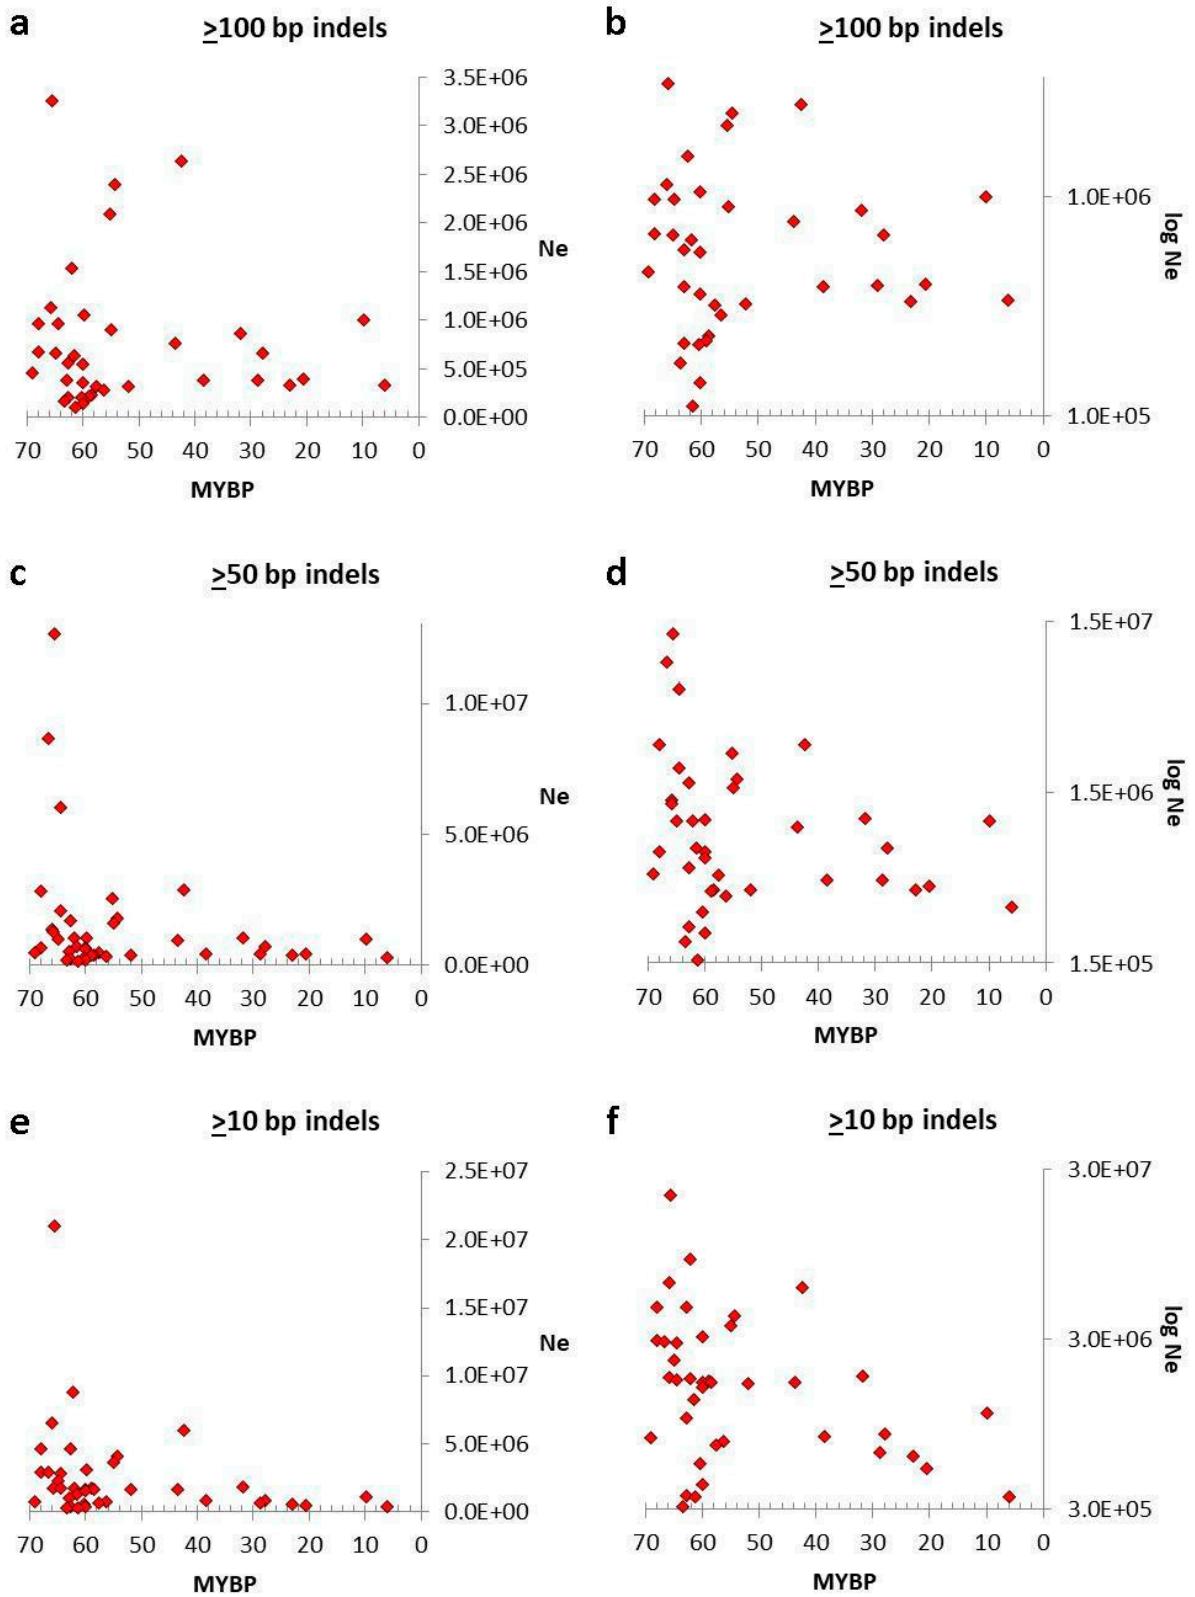

Figure S1. Estimated N_e of size partitioned intronic indels plotted on MP-EST* timetree time scale. (a, b) ≥ 100 bp indel size class; (c, d) ≥ 50 bp indel size class; (e, f) ≥ 10 bp indel size class; (g, h) ≥ 12 bp indel size class; (i, j) all indels size class; (a, c, e, g, i) N_e in linear scale; (b, d, f, h, j) N_e in log scale. Symbols as in Figure 3 of main text. MYBP = million years before present.

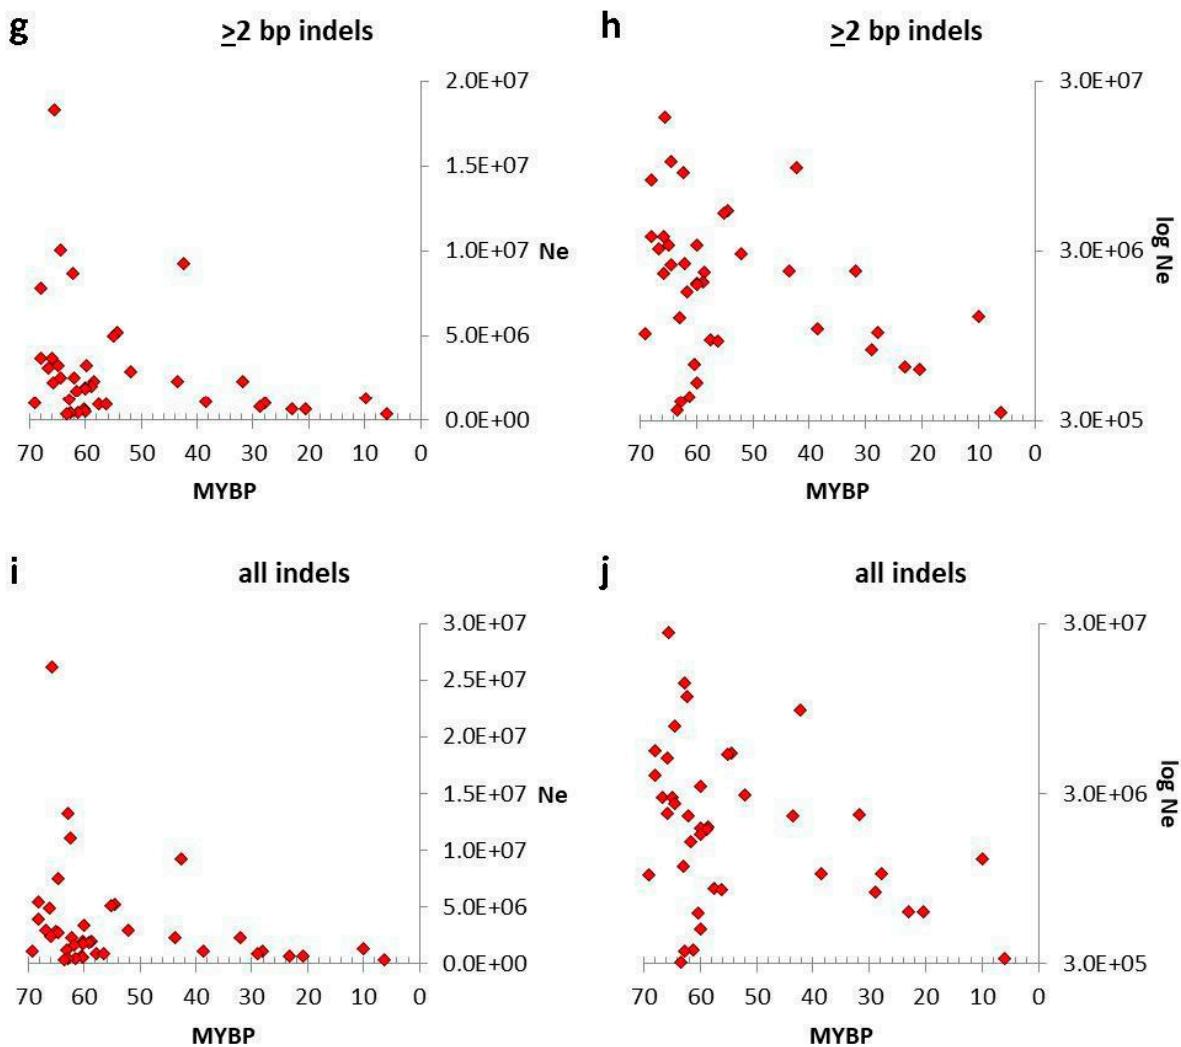

Figure S2. Estimated N_e of size partitioned intronic indels plotted on TENT timetree time scale. (a, b) ≥ 100 bp indel size class; (c, d) ≥ 50 bp indel size class; (e, f) ≥ 10 bp indel size class; (g, h) ≥ 12 bp indel size class; (i, j) all indels size class; (a, c, e, g, i) N_e in linear scale; (b, d, f, h, j) N_e in log scale.
