

Table S1: A list of 1208 Queensland rainforest species used to create the CSEQ and CQC phylogenies, showing the available GenBank Accession numbers for the 3 standard sequence markers *matK*, *rbcL* or *psbA-trnH*. All sequences with Accession numbers are publicly available from the open access sequence database, GenBank (<https://www.ncbi.nlm.nih.gov/genbank/>). (*) Indicates DNA barcode sequences produced at the University of the Sunshine Coast (UniSC) that have been submitted to the BOLD database and awaiting publication. (**) Indicates unpublished DNA barcode sequences produce in the laboratories of the National Museum of Natural History, Smithsonian Institution, Washington D.C., U.S.A. (#) Indicates sequences produced at the Australian Tropical Herbarium (ATH) Cairns, Queensland, Australia, available from the Public Data Portal of the BOLDSYSTEMS database (<https://www.boldsystems.org/>). (c) Indicates species that have one congener sequence included in the 3 gene DNA barcode when only one marker existed for that species.
