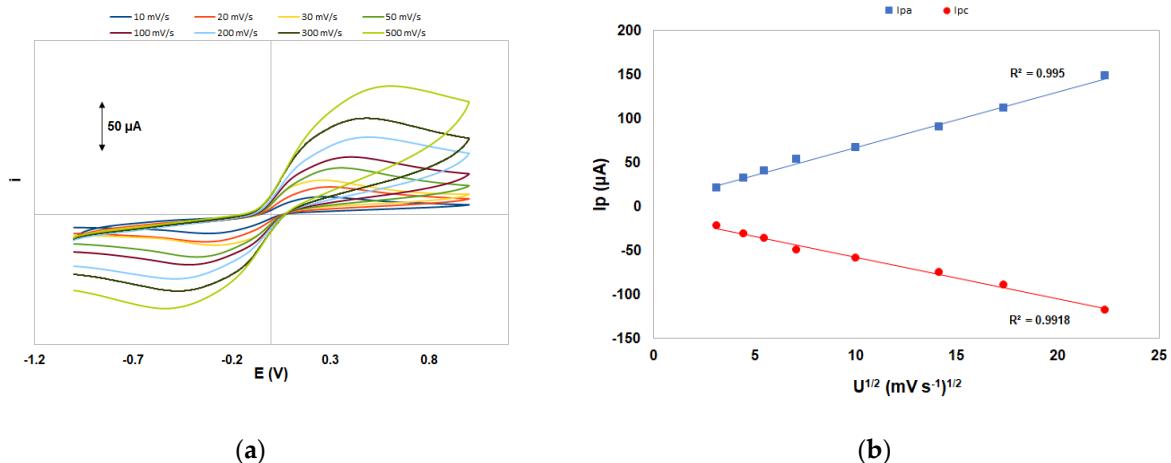

Figure S1. (a) CVs at the ePADs in 0.002 mol L<sup>-1</sup> potassium ferrocyanide/ 0.002 mol L<sup>-1</sup> potassium ferricyanide solution in 0.01 mol L<sup>-1</sup> KCl, (b) Plot of the anodic peak current ( $I_{pa}$ ) and the cathodic peak current ( $I_{pc}$ ) vs the scan rate ( $U$ ).

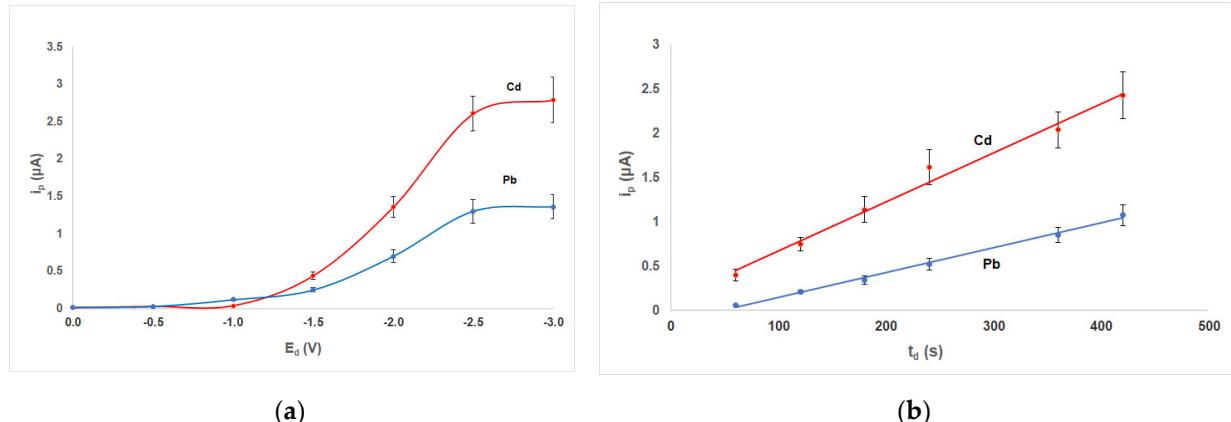

Figure S2. Effect of the (a) deposition potential, (b) deposition time on the stripping peak heights of Pb and Cd. Conditions: 200  $\mu g$  L<sup>-1</sup> Pb(II) and Cd(II); supporting electrolyte 0.5 mol L<sup>-1</sup> acetate buffer (pH 4.5) containing 10 mg L<sup>-1</sup> Bi(III); deposition time, 420 s; deposition potential -2.5 V.

Table S1. Comparison of existing electrochemical paper-based devices for the determination of Pb(II) and Cd(II) by stripping analysis (in grayscale are the applications dealing with simultaneous determination of the two target metals).
