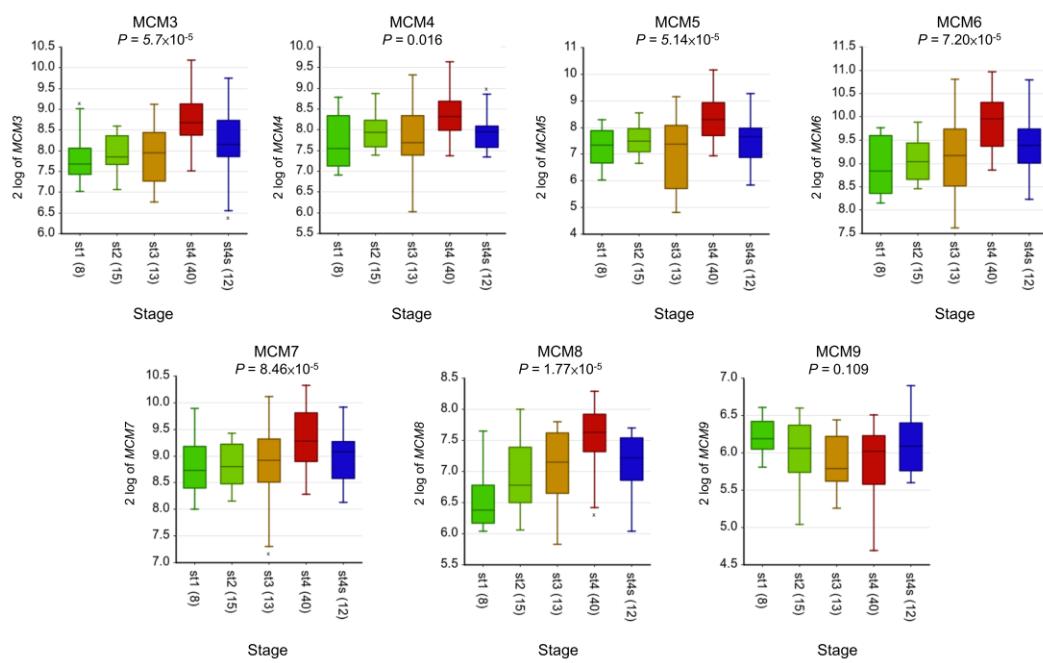

Figure S1. MCM member gene expression across INSS stages in the Vesteeg-88 database

Box-plots of MCM3-9 expression in each INSS stage. The expression increases with the stage development, despite the stage 4S, is relatively low (generally better prognosis for this stage of disease). The x-axis represents the INSS stage with patient numbers shown in parentheses.

SEQC - 498 - RPM - seqcnb1

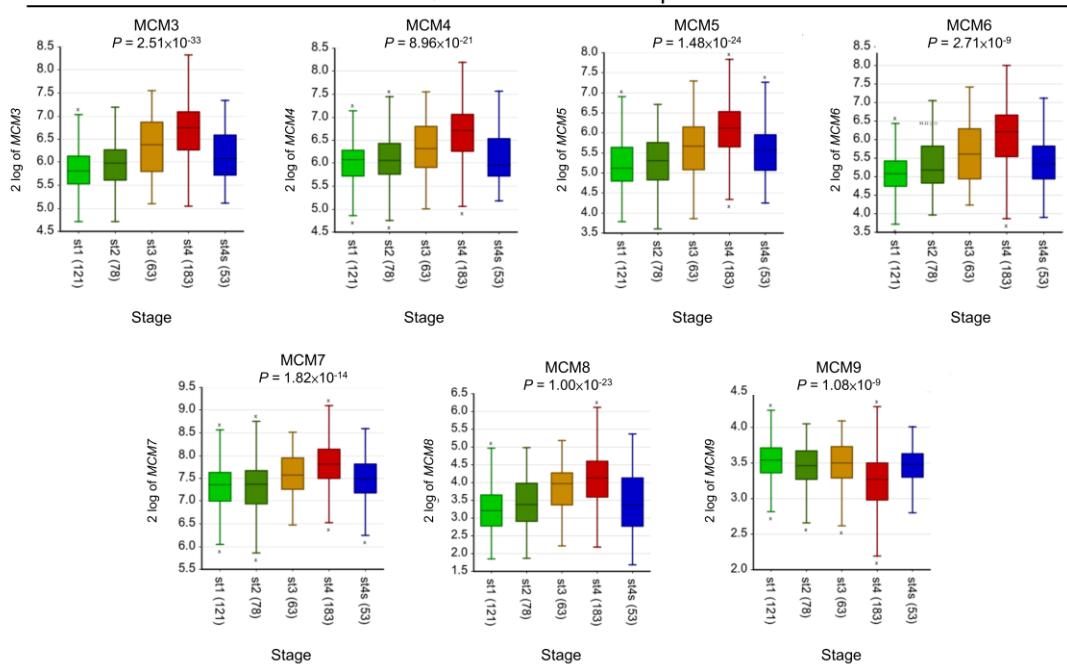

Figure S2. MCM member gene expression across INSS stages in the SEQC-498 database

Box-plots of MCM3-9 expression in each INSS stage. The expression increases with the stage development, despite the stage 4S is relatively low (generally better prognosis for this stage of disease). The x-axis represents the INSS stage with patient numbers shown in parentheses.

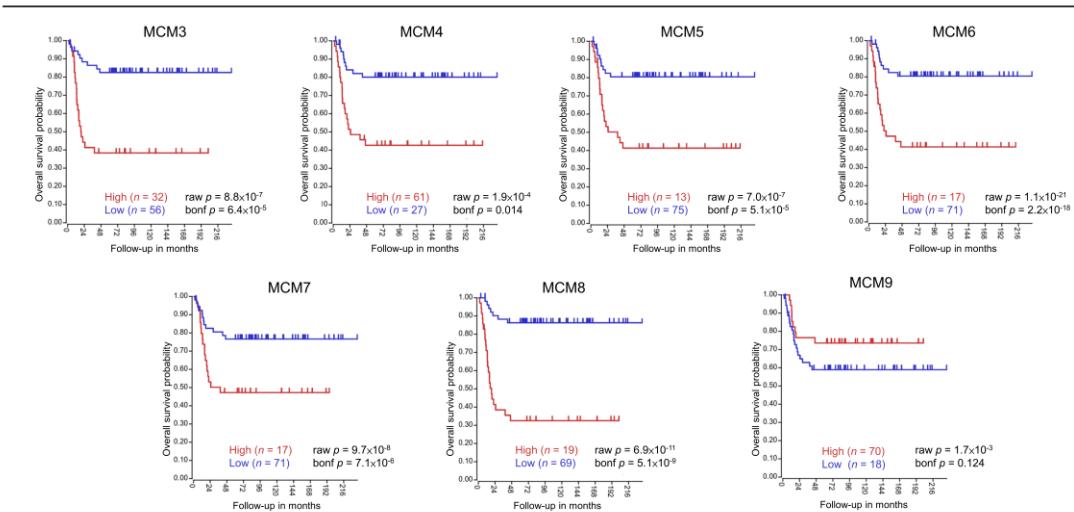

Figure S3. The over-all survival of neuroblastoma patients stratified by expression of each of *MCM* member genes in the Versteeg-88 database

The over-all survival was visualized by Kaplan Curve. High and low expression were denoted as red and blue, respectively. High expression of *MCM* genes correlated with poor survival except *MCM9*.

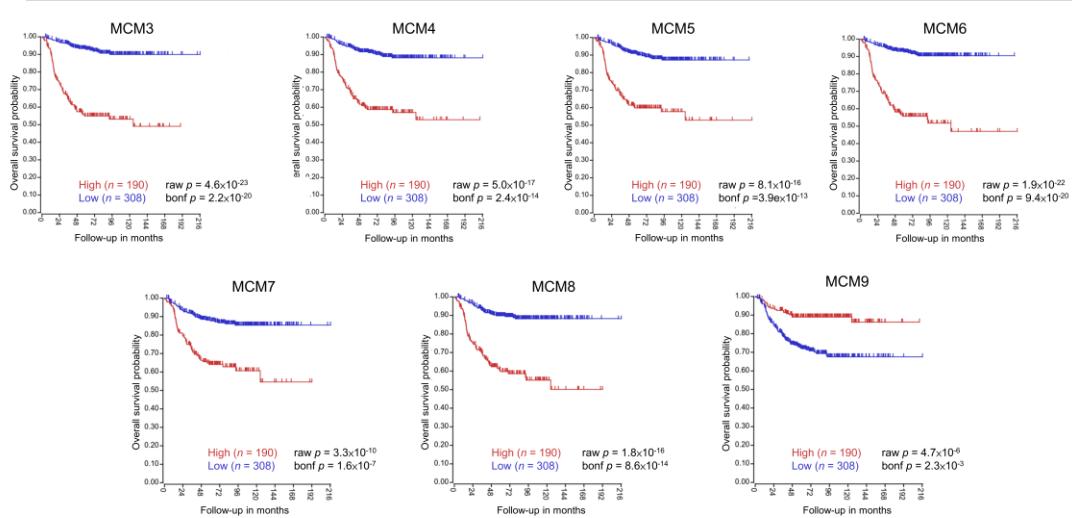

Figure S4. The over-all survival of neuroblastoma patients stratified by expression of each of MCM member genes in the SEQC-498 database

The over-all survival was visualized by Kaplan Curve. High and low expression were denoted as red and blue, respectively. High expression of MCM genes correlated with poor survival except MCM9.

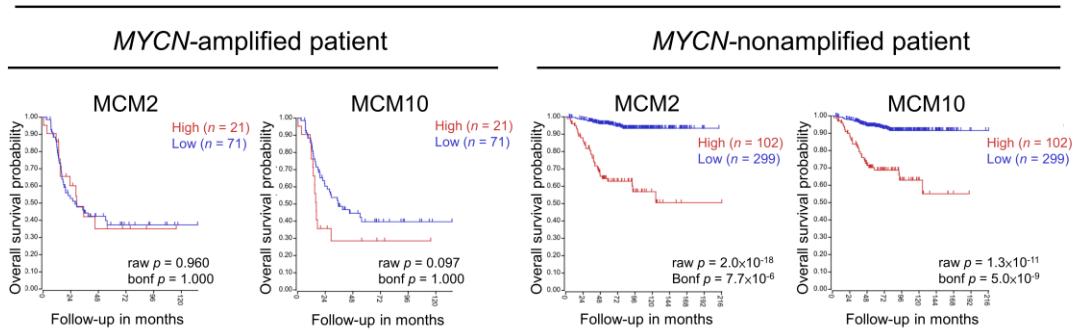

Figure S5. The overall survival of patients *MYCN*-amplified or *MYCN*-nonamplified tumor and stratified by expression of *MCM2* or *MCM10* in different databases

The over-all survival was visualized by Kaplan Curve. High and low expression were denoted as the color red and blue, respectively. In *MYCN*-amplified samples, the difference between survival rates was not significant. In *MYCN*-nonamplified tumors, high expression of *MCM2* and *MCM10* correlated with poor survival.

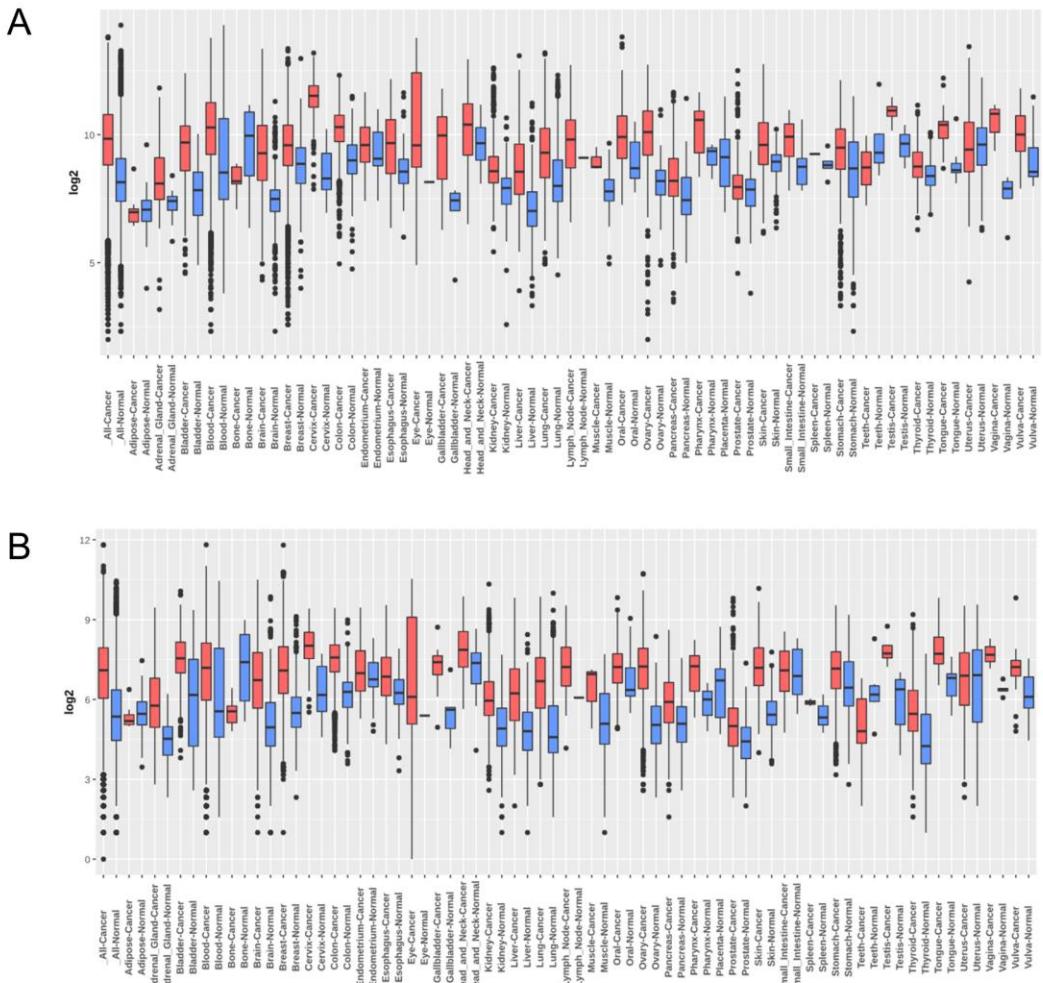

Figure S6. *MCM2* and *MCM10* expression across 35 cancer types and corresponding normal tissue

Expression of (A) *MCM2* and (B) *MCM10* across 35 tumor types. Using HG-U133_Plus_2 platform, the analysis was done by GENT2. The blue bars represent normal cells and red bars represent cancer cells.

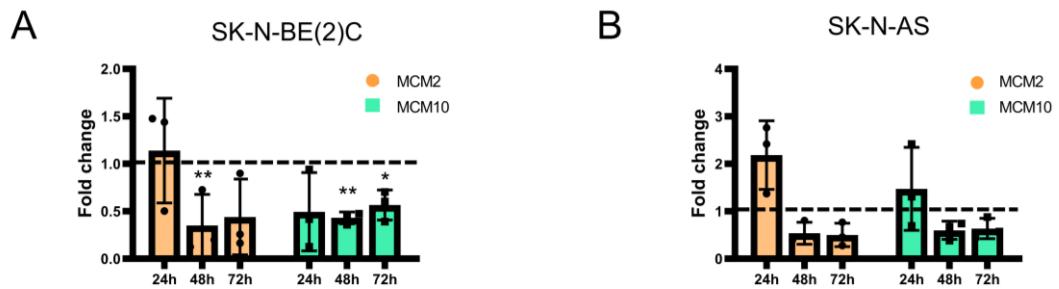

Figure S7. Protein expressions of Knockdown efficiency of MCM2 and MCM10 in two cell lines

The data represent the average protein expressions of MCM2 and MCM10 normalized by β -actin. $*P < 0.05$, $**P < 0.01$ from two-tailed unpaired Student's *t*-test to determine whether the mean value of a given group is equal to the corresponding si*Ctrl* group alone group

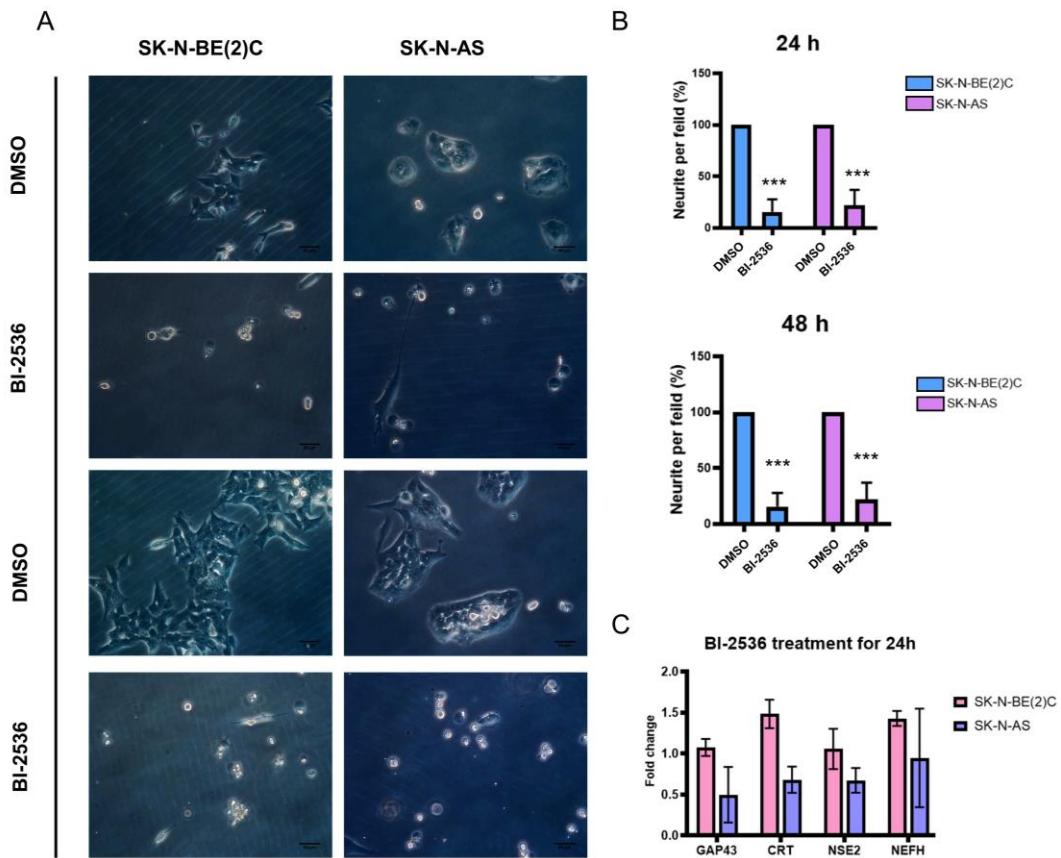

Figure S8. Cell morphology and expression changes of differentiation markers after BI-2536 treatment in neuroblastoma cells

(A) The number of neurites were decreased after BI-2536 treatment for 24 and 48 h. The cells floated from the bottom of culture dish and shrunk into ball shape, indicating cell death. (B) Statistical neurites number per cell per field reveal that neurites significantly decreased after BI-2536 treatment in SK-N-BE(2)C and SK-N-AS for 24 h. (C) Common differentiations marker genes: *GAP43*, *CRT*, *NSE2* and *NEFH* were checked by qRT-PCR. No significant change of differentiation markers was observed (upregulation of the marker genes indicate differentiation). The results show that cells did not undergo differentiation after BI-2536 treatment. * $P < 0.05$, ** $P < 0.01$, *** $P < 0.001$ from two-tailed unpair student *t*-test..
